DAY 1: INSTALLING WINDOWS IN VIRTUAL BOX AND COMPLETE THE 36 VIDEOS OF NETWORK CHUCK

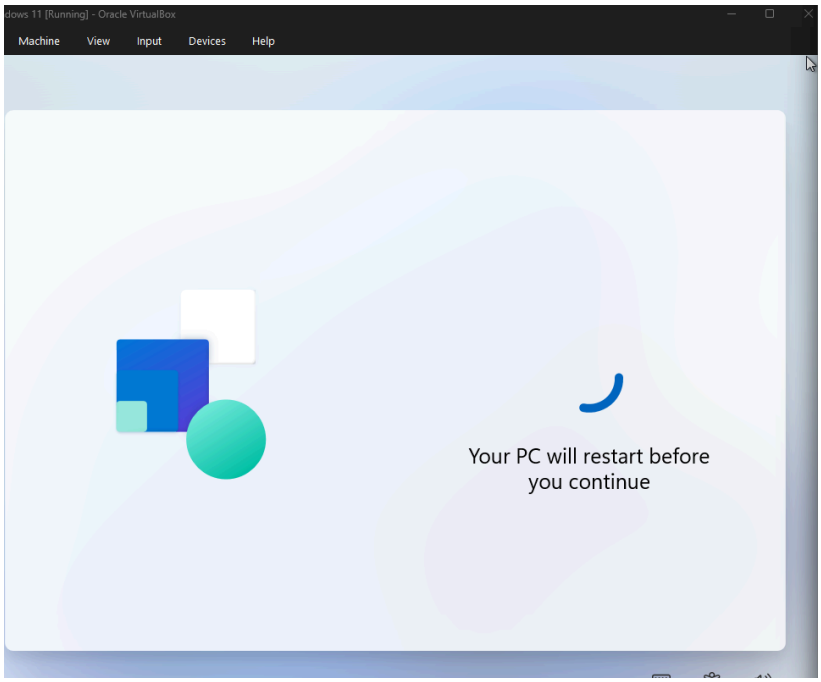

INSTALL VIRTUAL BOX FROM HERE AND CHOOSE WINDOWS HOST.

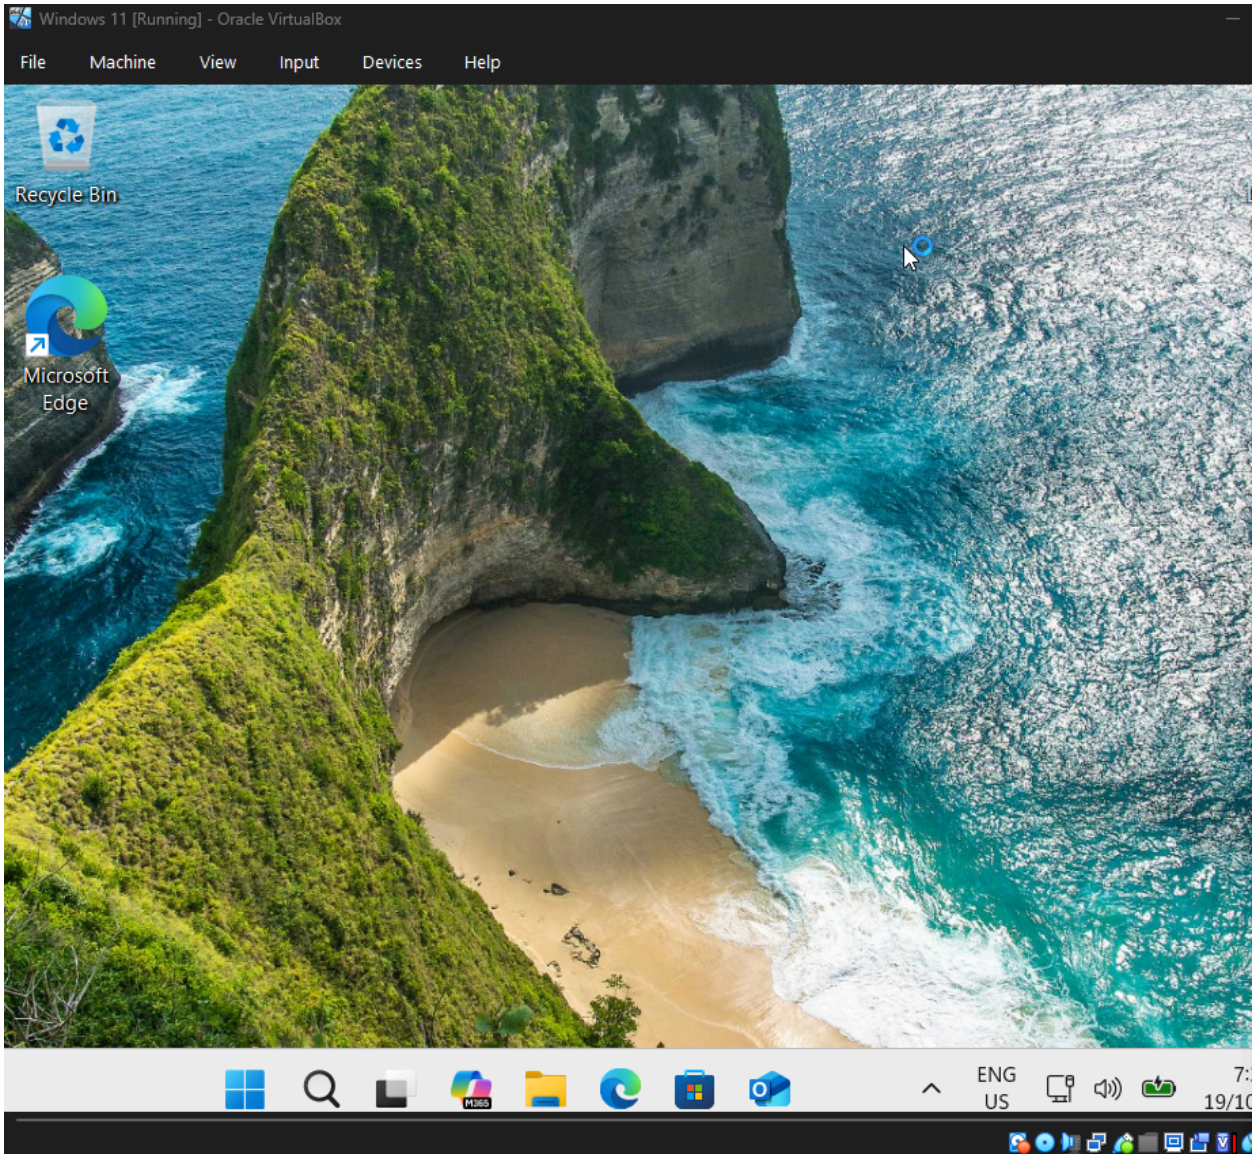

DOWNLOAD WINDOWS ISO FROM HERE

Setup virtual box to run the windows, ram 4gb and 2 processors and cpu 12 and also disk space 80gb.

Setup windows in the virtual box (Windows pro)

FINALLY DONE

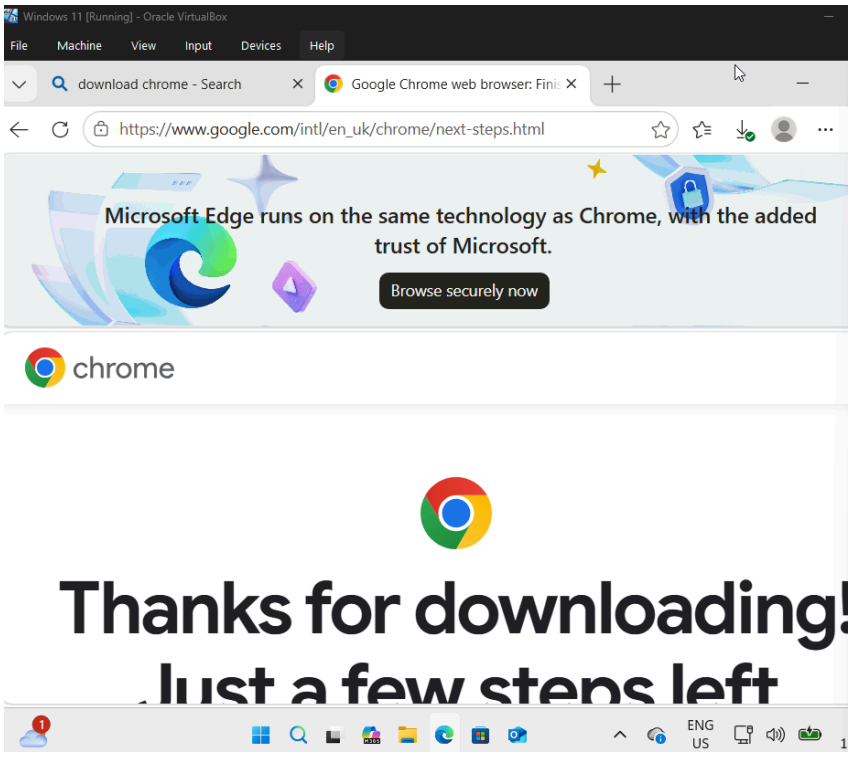

TASK 2 : Window History and GUI

Started in 1981 as MS DOS based **on CLI.** And the **latest windows 11 was in 2021.**

GUI is actually what **we are looking at as colours, the cursors and other parts of windows.**

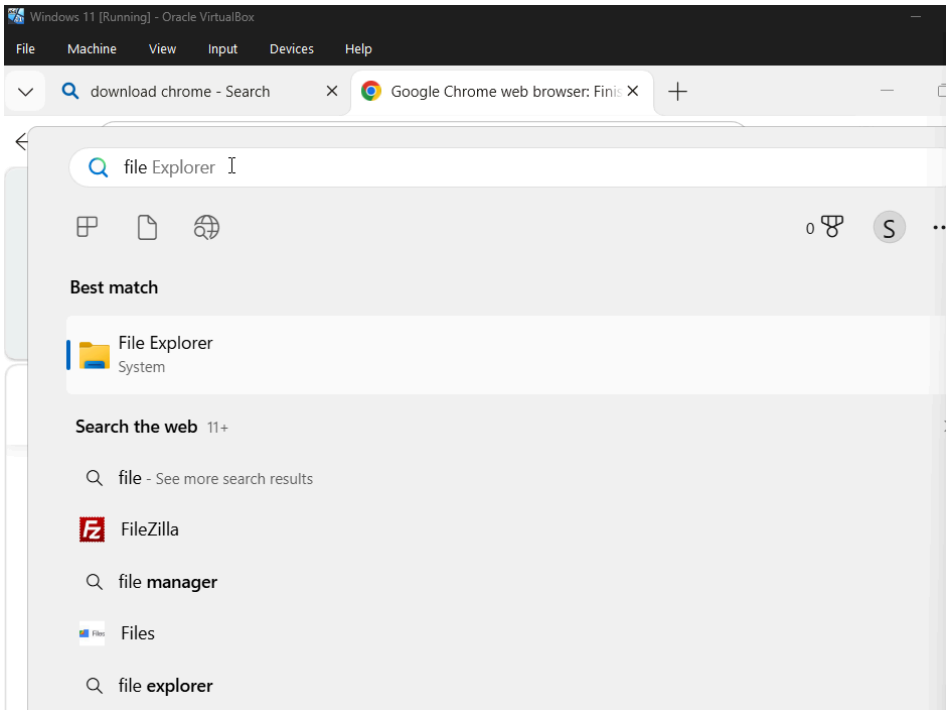

Consists of

- Task bar
- Windows bar
- Pinned apps
- Desktop
- File system
- Browsers
- Shortcuts on apps

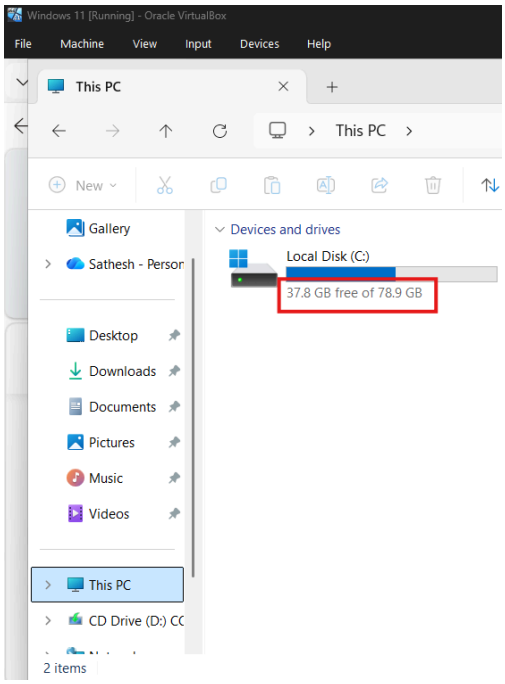

Installed Google chrome in our new windows 11 pro.

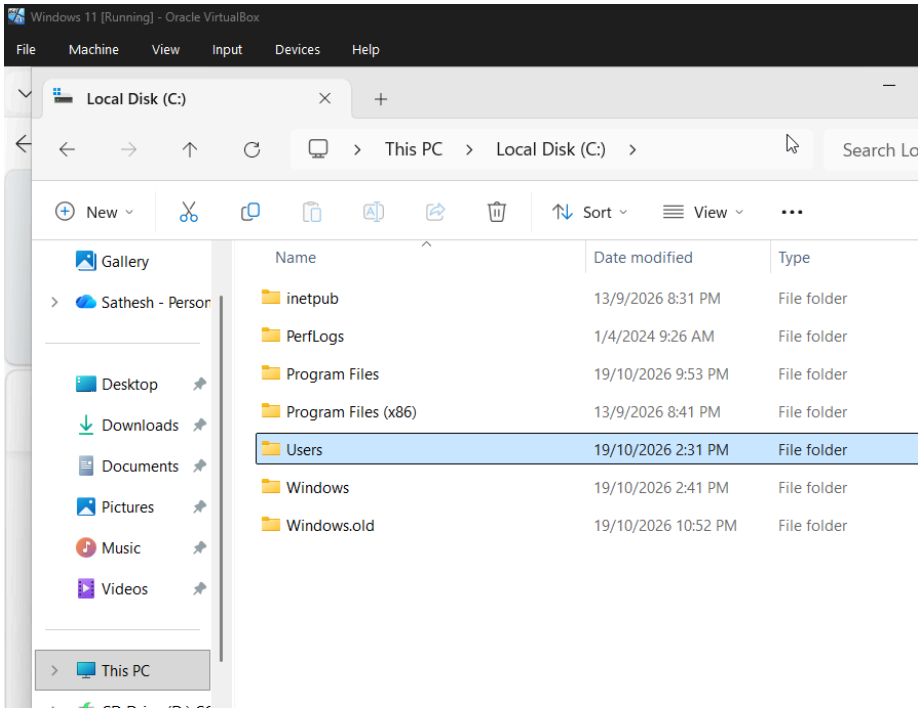

TASK 3 : Window OS Structure

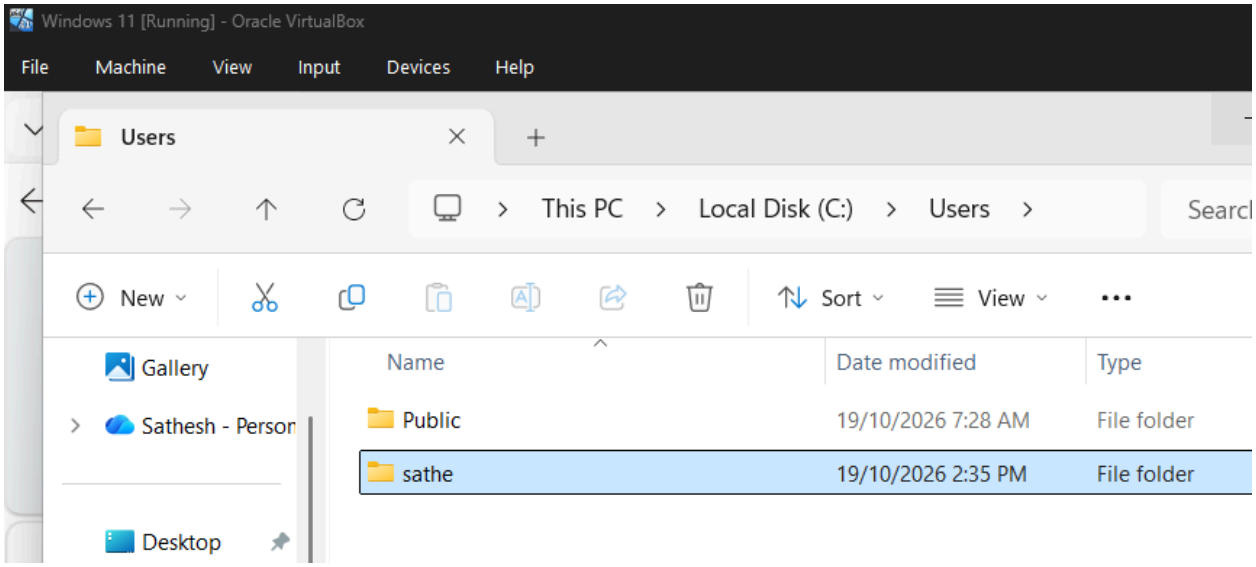

Go to File Explorer

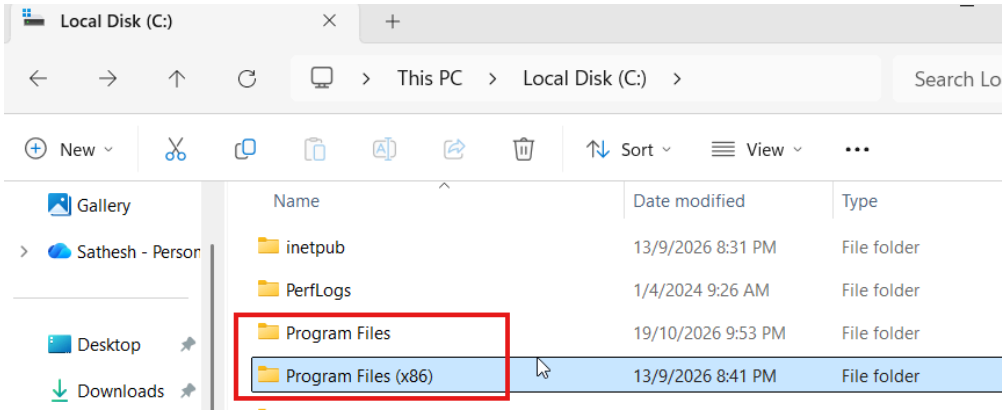

Now this is how much the windows consumed and there is still 38 GB plus space for us.

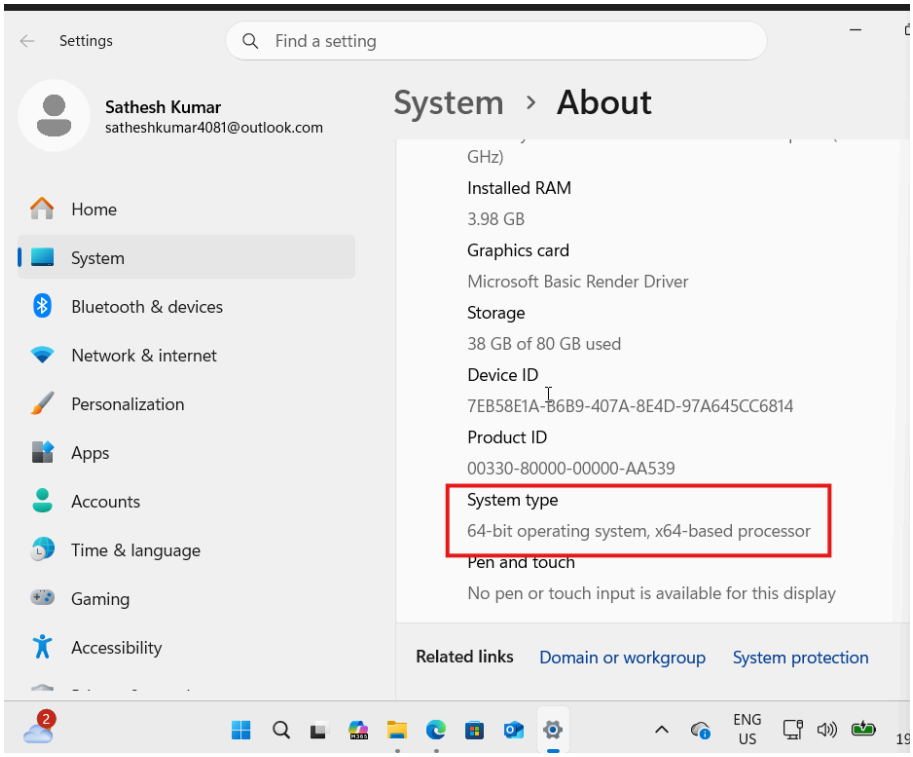

This is where all the user's details and hidden folder will be stored. You probably will find your name if you created this Windows account under your name.

See that's my name huhuuuu.

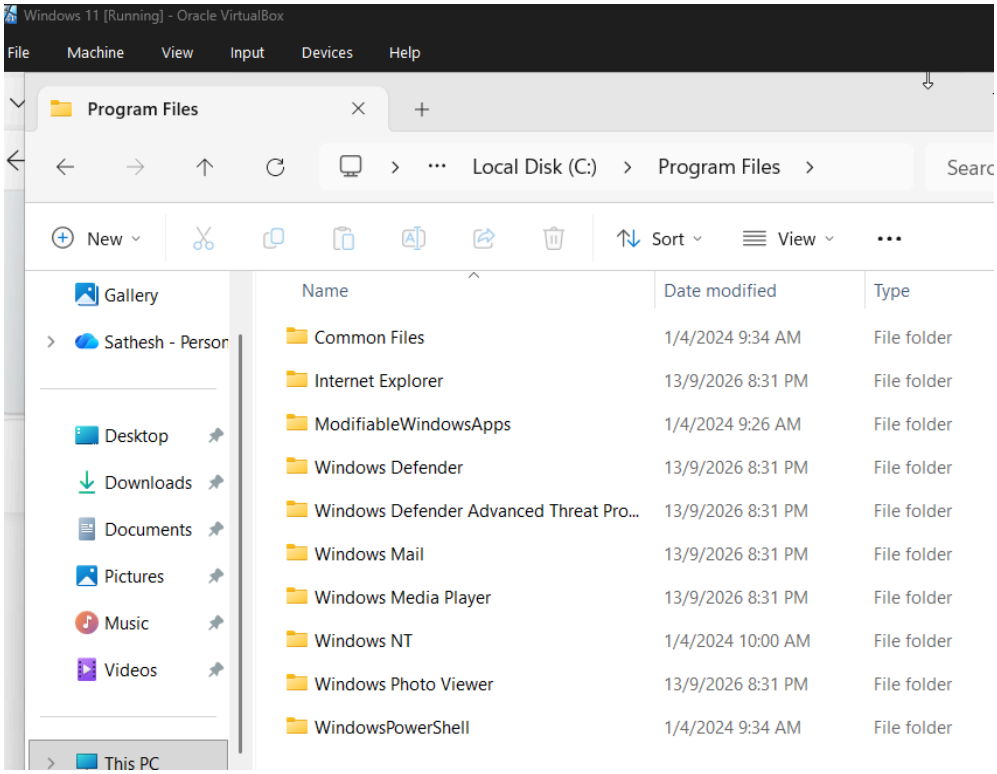

So these are the program files and there are two types of files here. These are the two type of applications you can install either x86 or the normal apps.

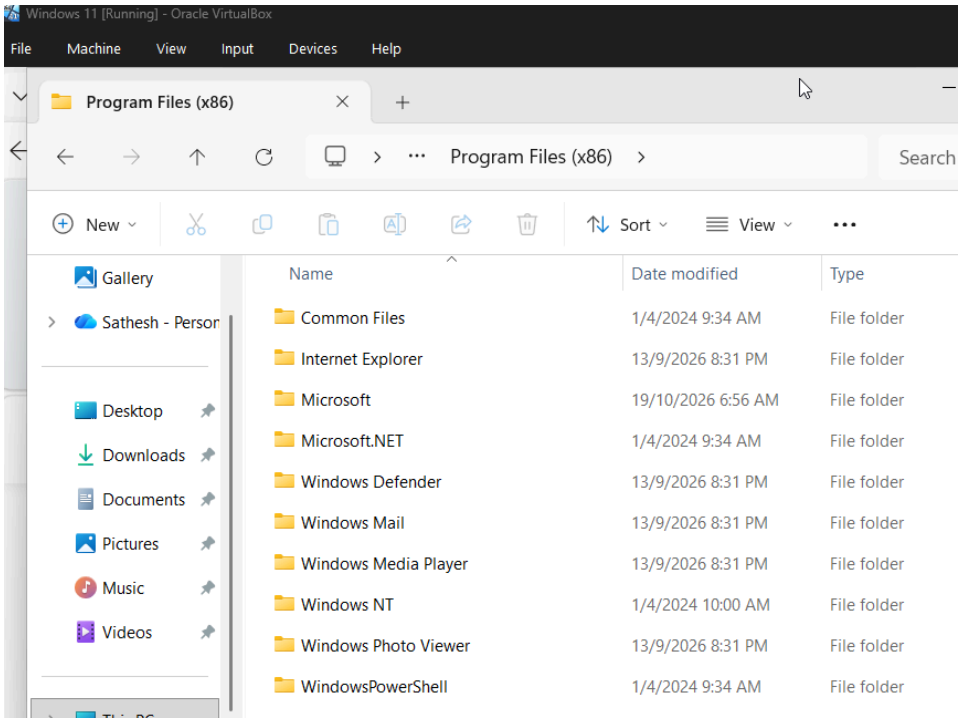

So if you RIGHT click on "This Pc" Tab and click "Properties" you will the settings will be opened. So if you scroll down in the System about page, you will systems types. So thats what i mentioned earlier as:

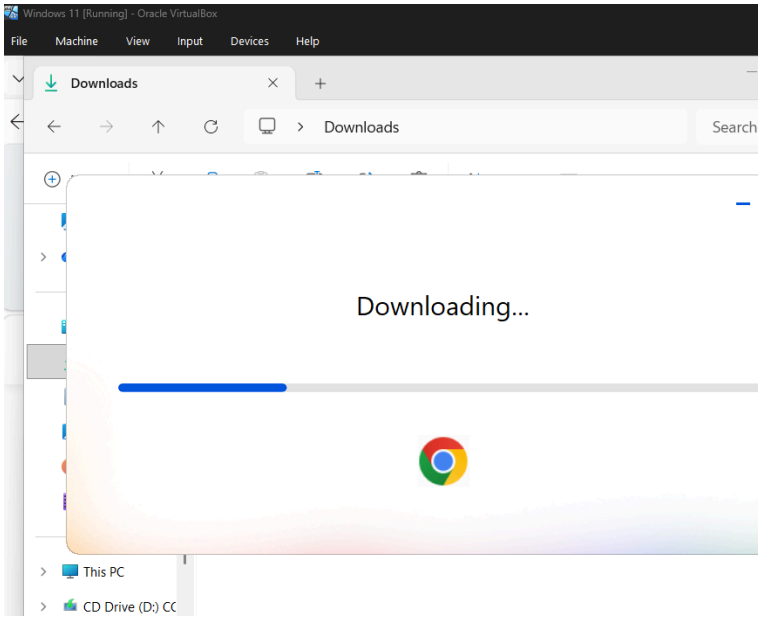

Program Files = 64 bit Apps stored
Program Files (x86) = 32 bit Apps stored

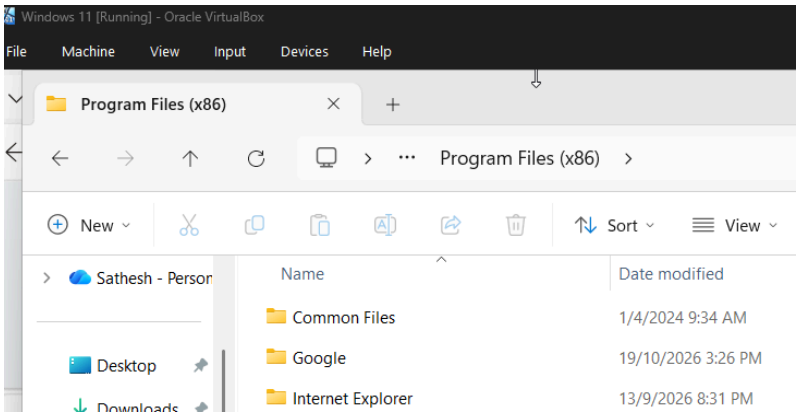

Inside the Program files we have 64 bits app Media player

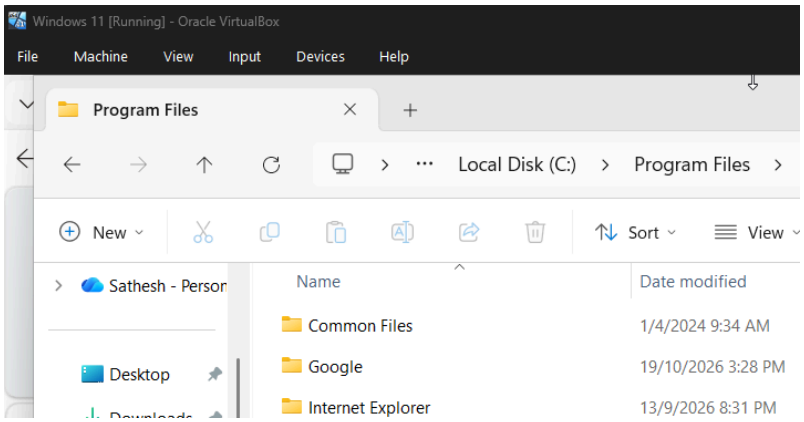

Inside the Program files we have 32 bits app Media player

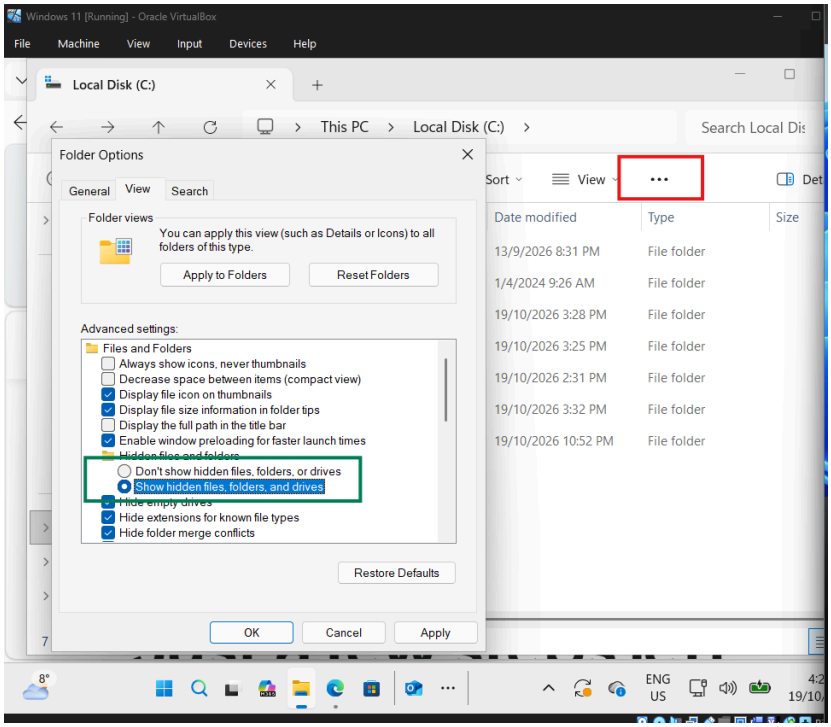

Now we are trying to install Chrome and see where this goes, is it in 64 bit or 32 bit files.

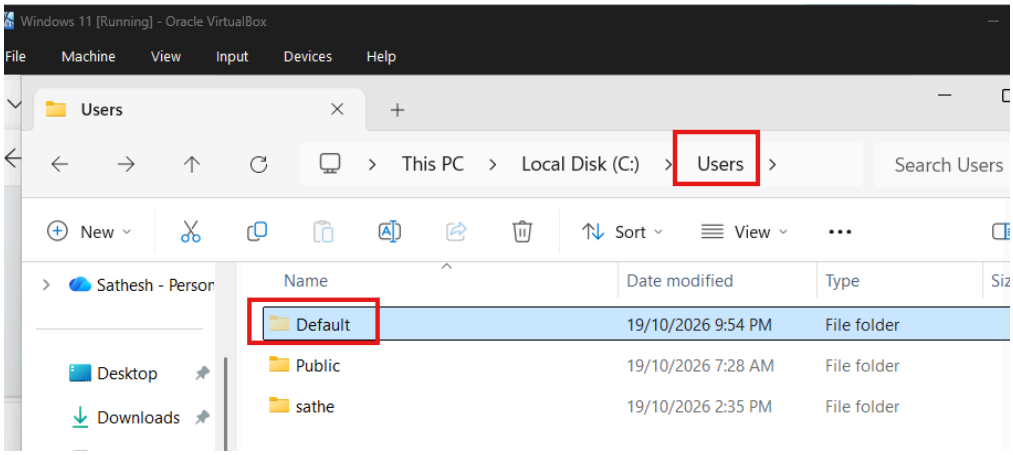

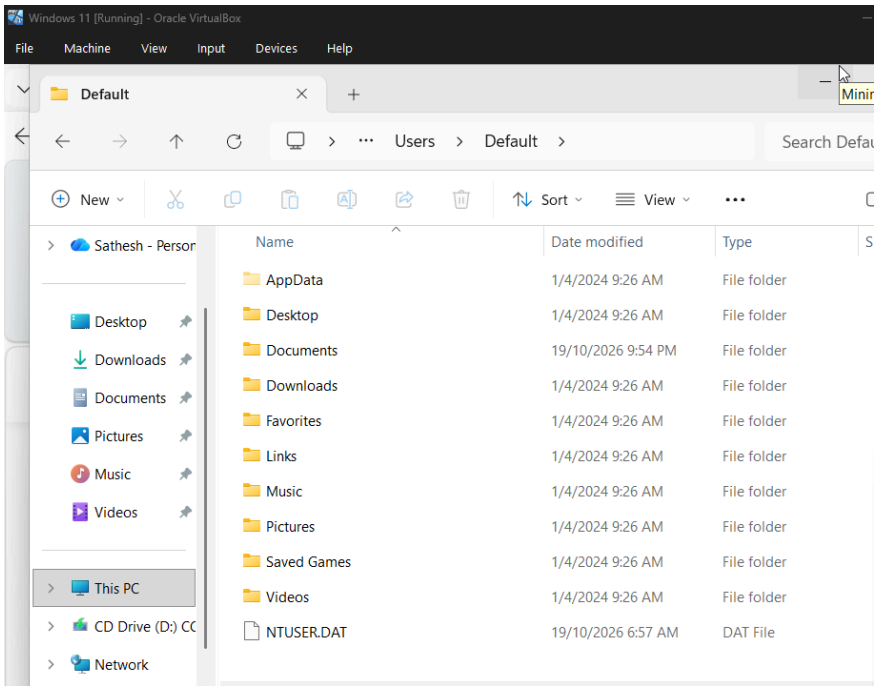

WOW Its downloaded on both 64 bit and 32 bit.

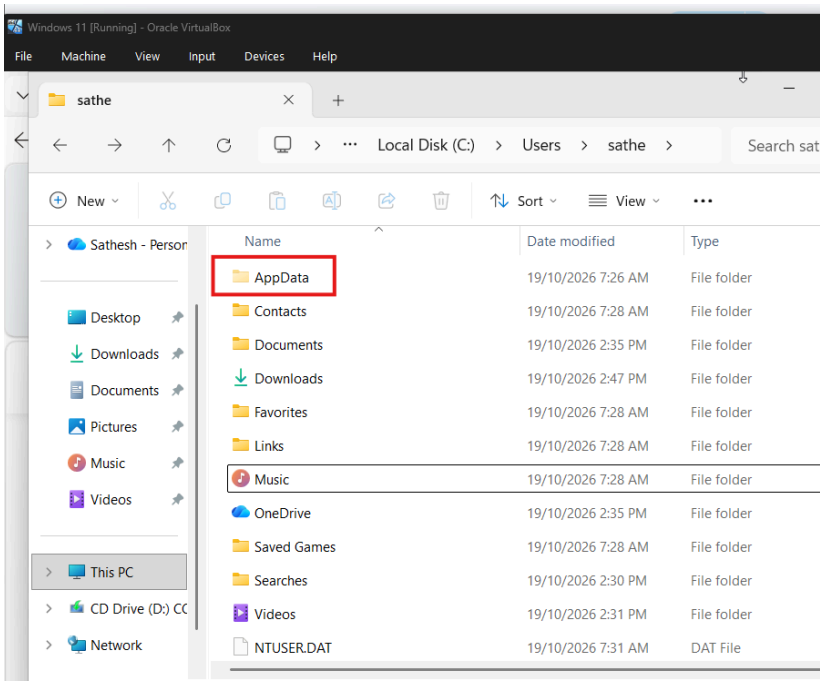

So now here to see the hidden files, click on the three dots on the right side, and select properties. Then when the Folder options box pop up, then click on VIEW tab and then tick the "Show Hidden Files" button.

Here when you go into Users file and you will see Default folder, enter there.

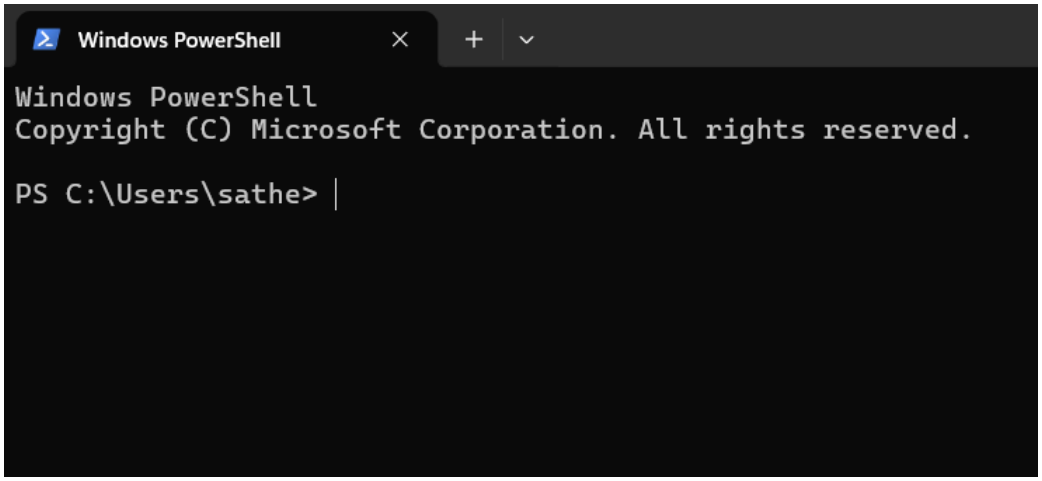

This folder is actually is a template on what files/folder we should have inside each user's folder.

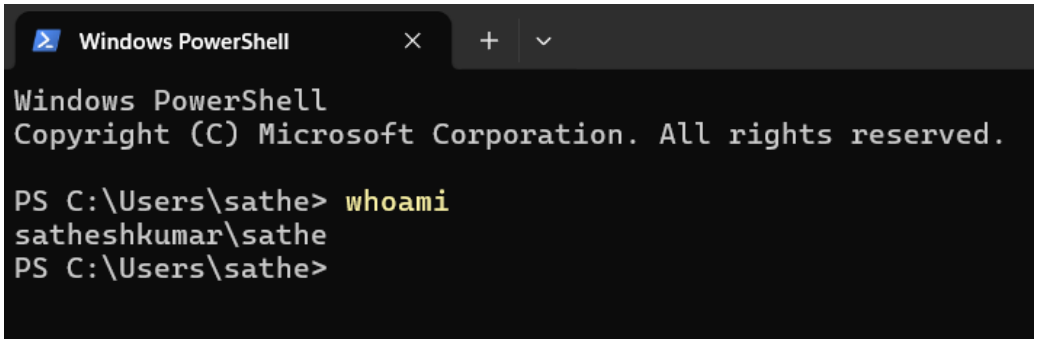

Here under my Folder you can see AppData folder. For example, Chrome's bookmark and other related info/files will be stored in this hidden folder.

TASK 4 : How to use terminal to navigate in Windows

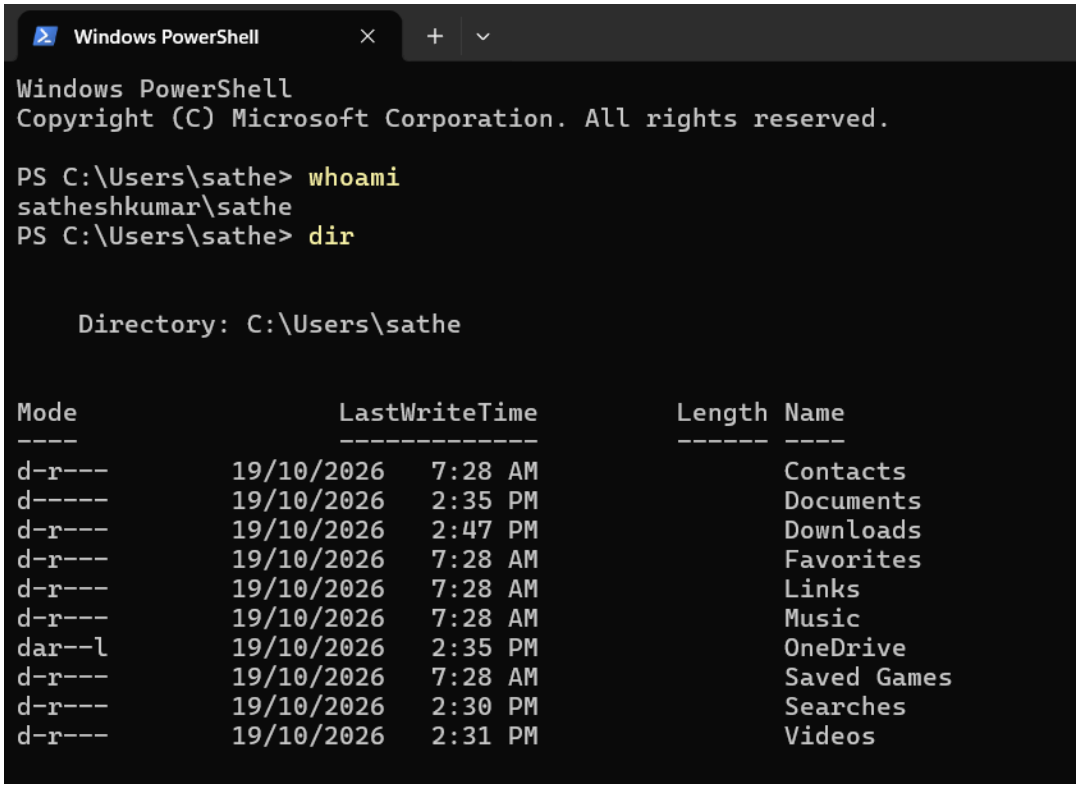

Terminal: PowerShell

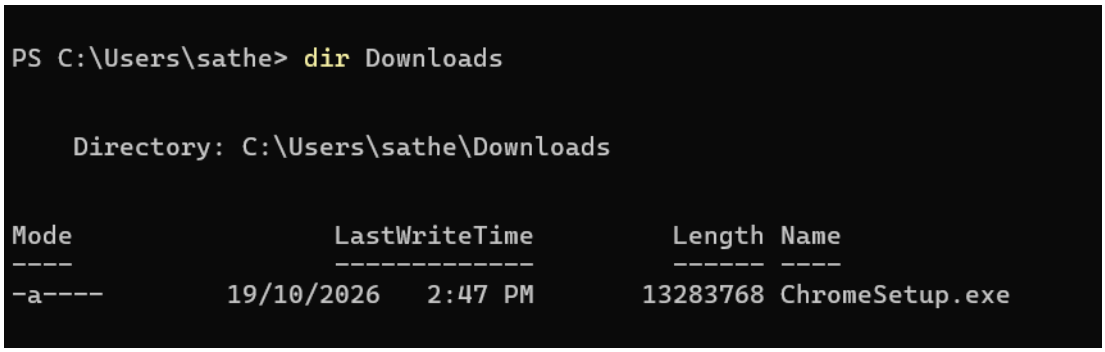

We are in the User "Sathes" Directory

Just type "whoami" and it will tell you the hostname.

Now i wanted to see what is inside the User directory i mentioned earlier. For that you have to type “dir” or “ls” (linux) command and boom you will see all the folders.

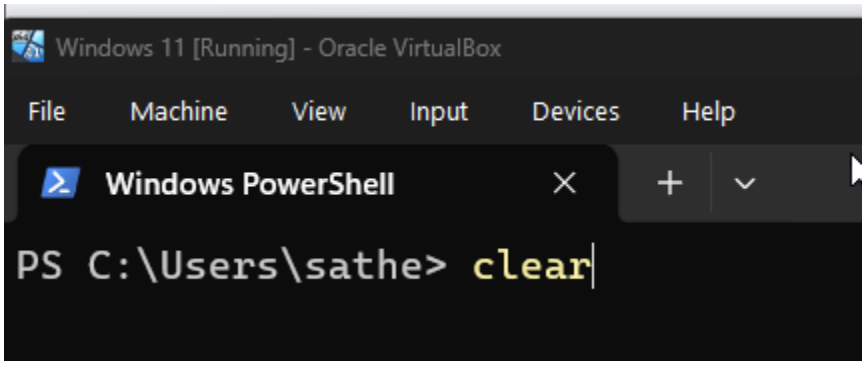

I want to see what is inside the “Downloads” directory and you can use “dir Downloads” command.

```
PS C:\Users\sathe> dir c:\

    Directory: C:\

Mode                 LastWriteTime         Length Name
----                 -------------         ------ ----
d-----         13/9/2026   8:31 PM                inetpub
d-----          1/4/2024   9:26 AM                PerfLogs
d-r---        19/10/2026   3:28 PM                Program Files
d-r---        19/10/2026   3:25 PM                Program Files (x86)
d-r---        19/10/2026   2:31 PM                Users
d-----        19/10/2026   3:32 PM                Windows
d-----        19/10/2026  10:52 PM                Windows.old
```

Here i used "dir c:\" command to go back to the previous directory.

Use this command to clear all the previous command lines.

If i want to CD (Change directory), i can use it as "cd Downloads" and you can see it changed to Downloads.

You can also use “cd ..” command to go back to the original directory.
