DAY 2: COMPLETE THE 36 VIDEOS OF NETWORK CHUCK AND BASICS OPERATIONS OF WINDOWS OS

TASK 1 : Window File System

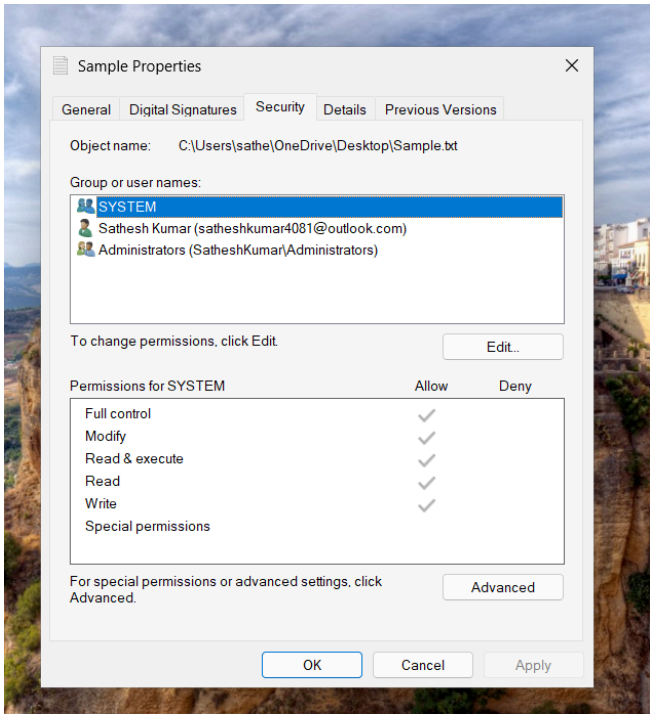

- Started as FAT (File allocation Table)
- 200MB it can store
- Now we have FAT 32, it can store 32GB.
- Now its more advance with NTFS (New tech file system) with storage of 16EB (exabytes) and its recoverable with logs file and can set permissions.

File System Permissions

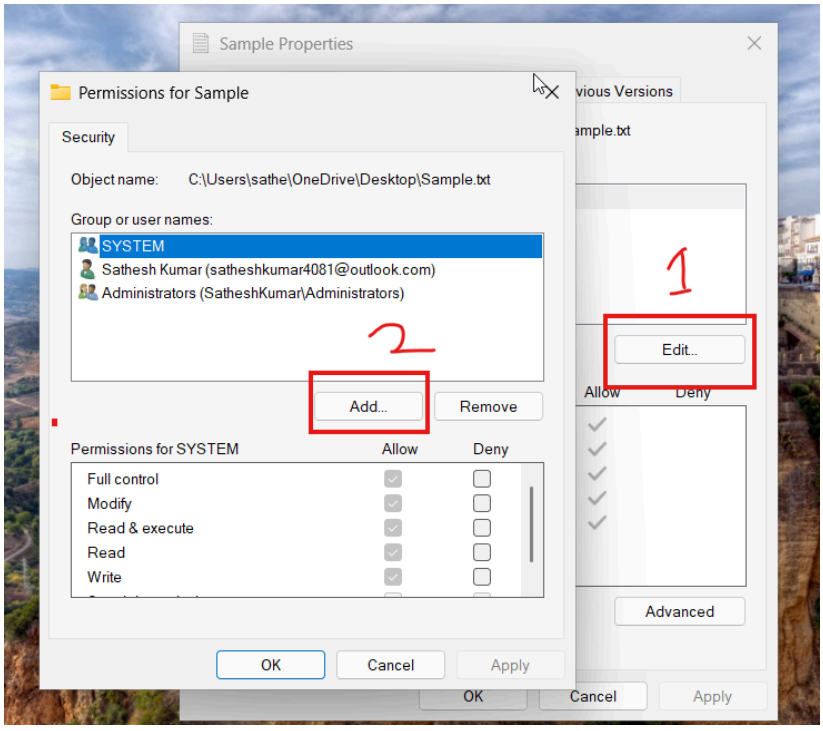

We are going to create a sample Notepad and see what kind of permissions we can give it to the file.

Now its created

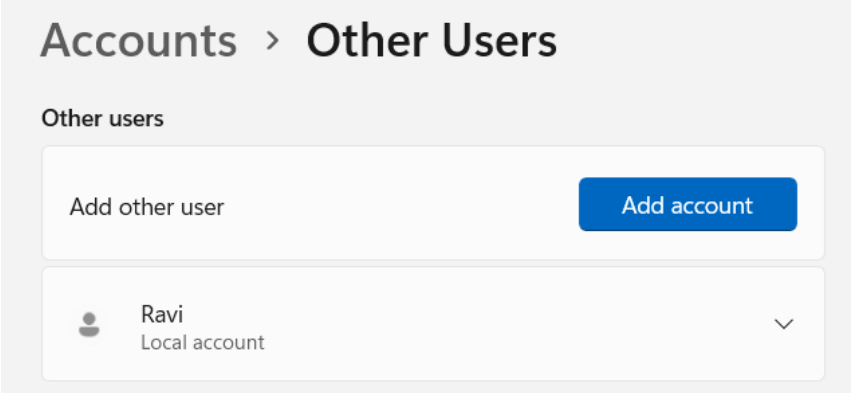

Now right click on the Notepad and click on “Properties”, then go to the Security tab.

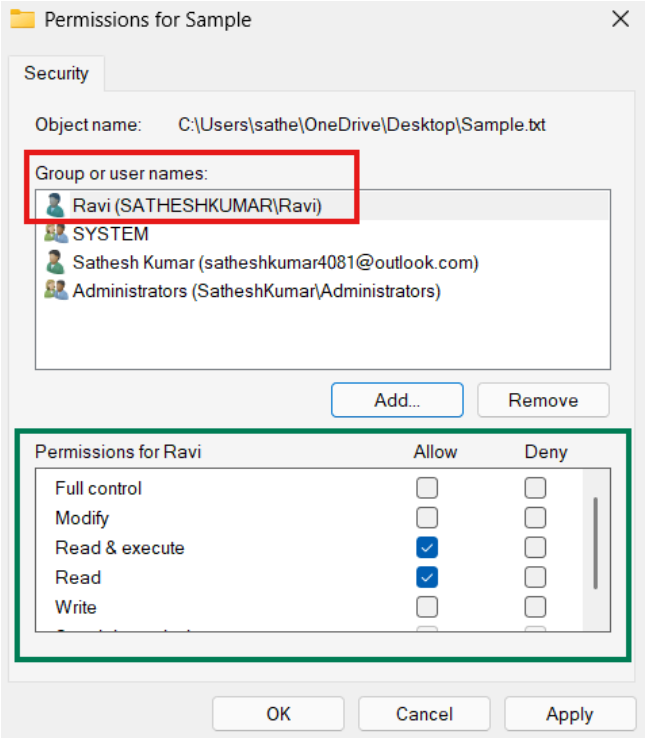

So over here in the Properties box click on Edit and then another box will pop up, so click on add. Here we are going to simply add another use for the file and set permissions for him/her.

Steps: Create a User Account (This has to be done before setting file permissions)

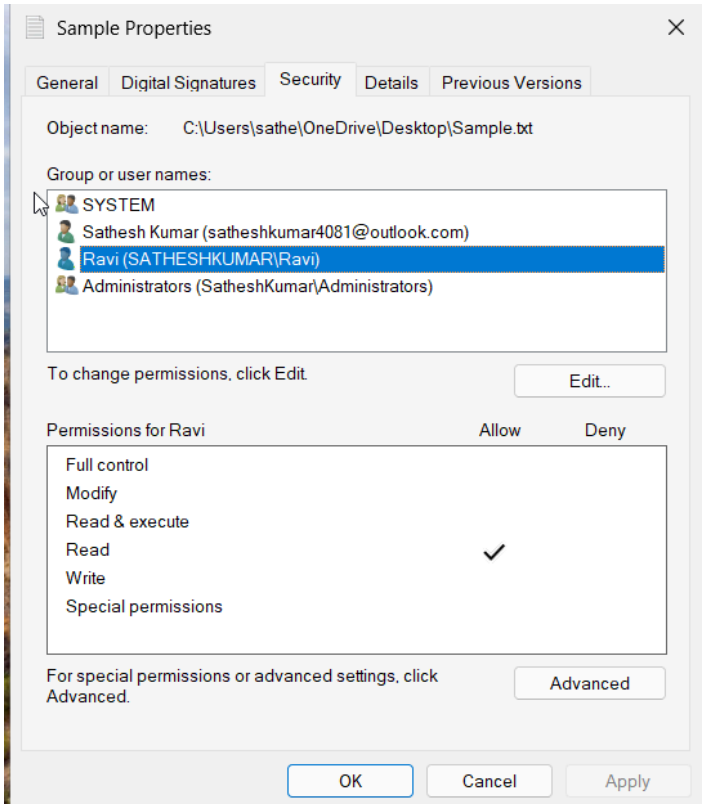

1. Press the **Windows Key + I** to open **Settings**.
2. Go to **Accounts** > **Other users** (or **Family & other users**).
3. Click **Add account** or **Add someone else to this PC**.
4. Choose *"I don't have this person's sign-in information"* and select **Add a user without a Microsoft account**.
5. Enter a **username** and **password**, then follow the prompts to finish

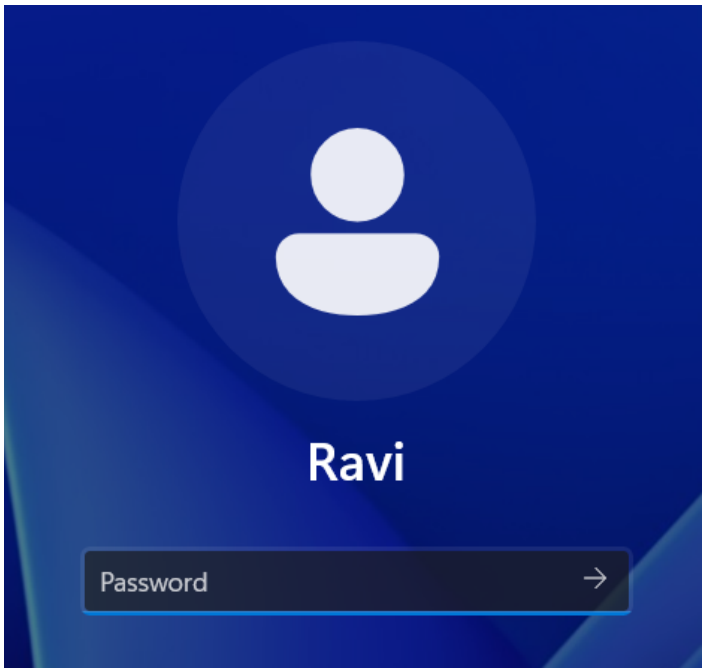

I have created a new user "Ravi: in the account. Now we are good to set permissions for him in the File system.

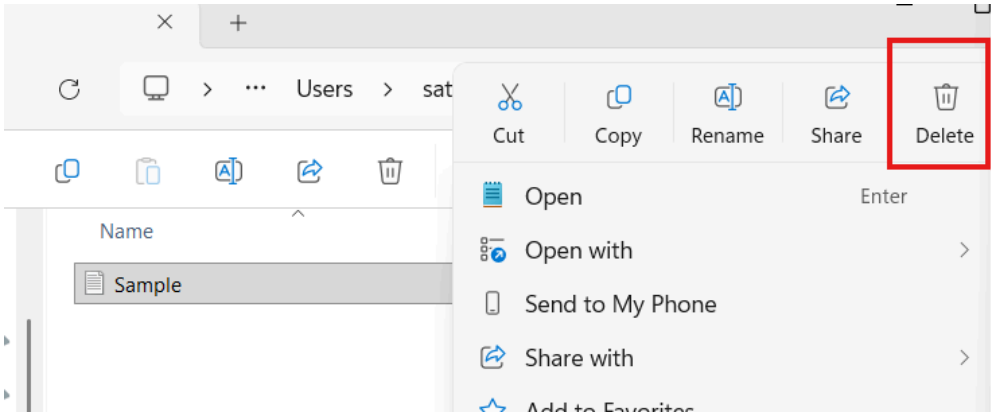

So we have added Ravi successfully to the file system and now we going to set the permissions as ONLY READ.

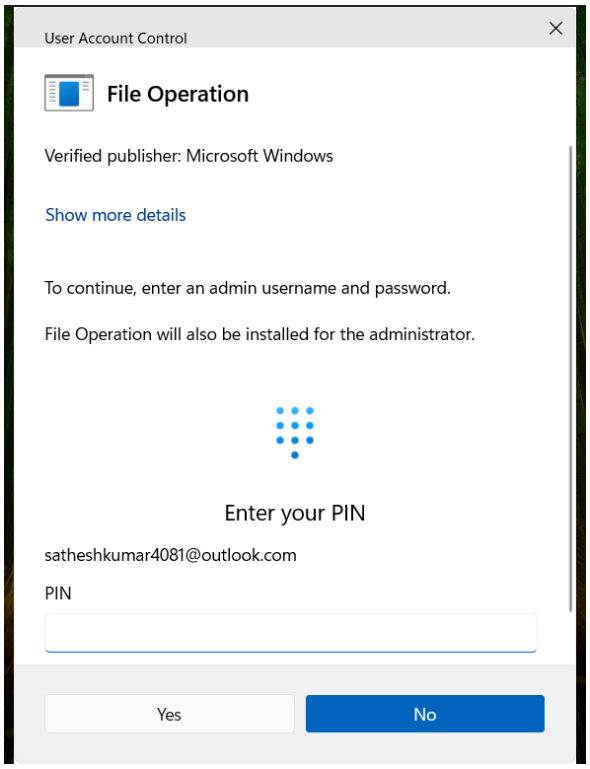

So now Ravi only can READ.

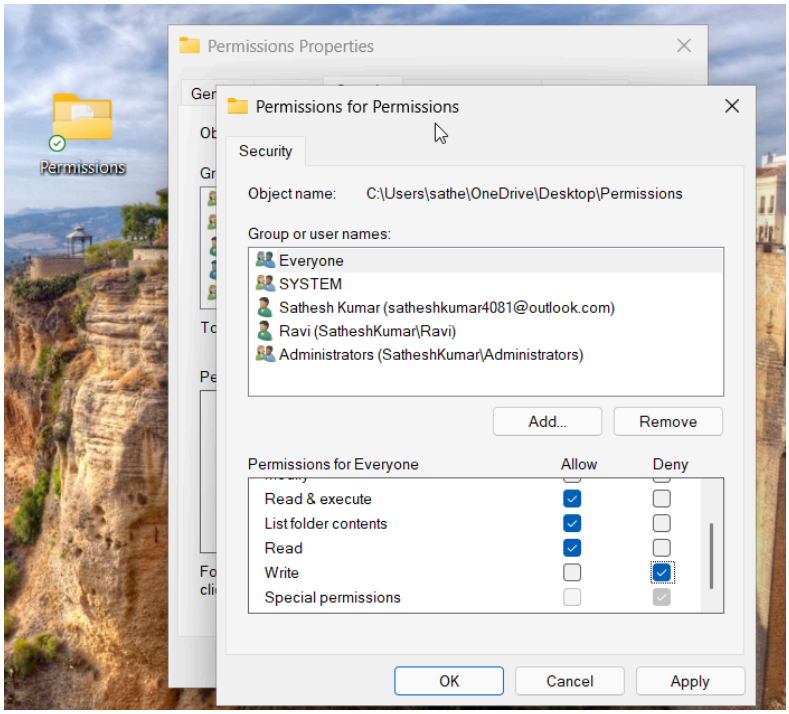

Entering Ravi's Account now

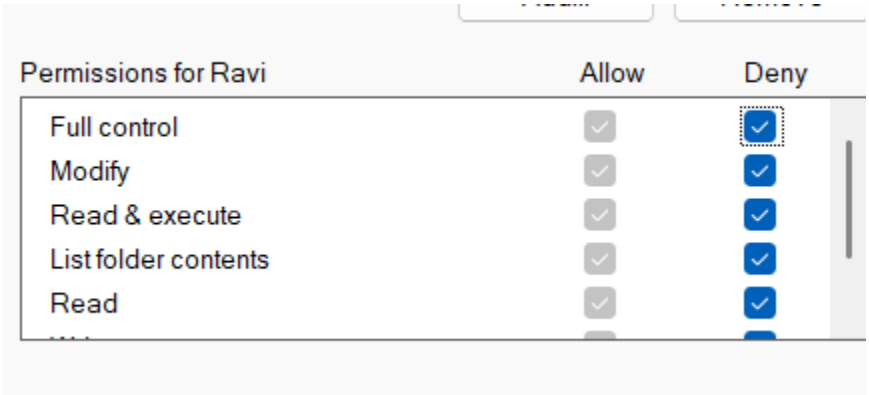

So now let me try to delete this Notepad file. Let's see what happens next.

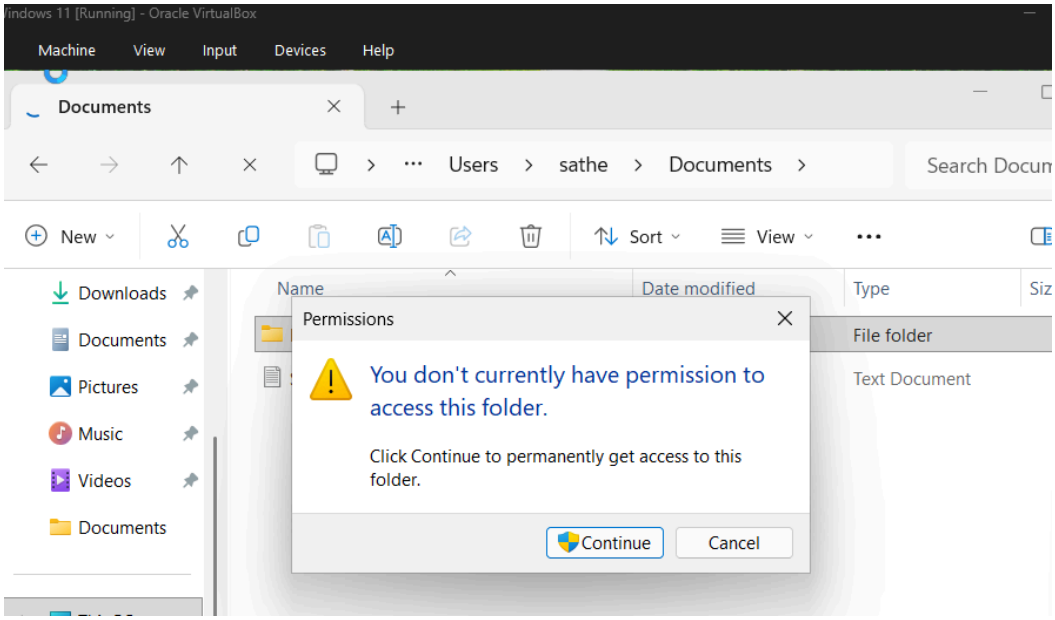

This box pops out so you need admin permission to delete this file now.

Now 2nd scenario where we wanna see whether we set permissions for a folder (Ravi) and see whether that permissions inherits to the file inside the folder or not.

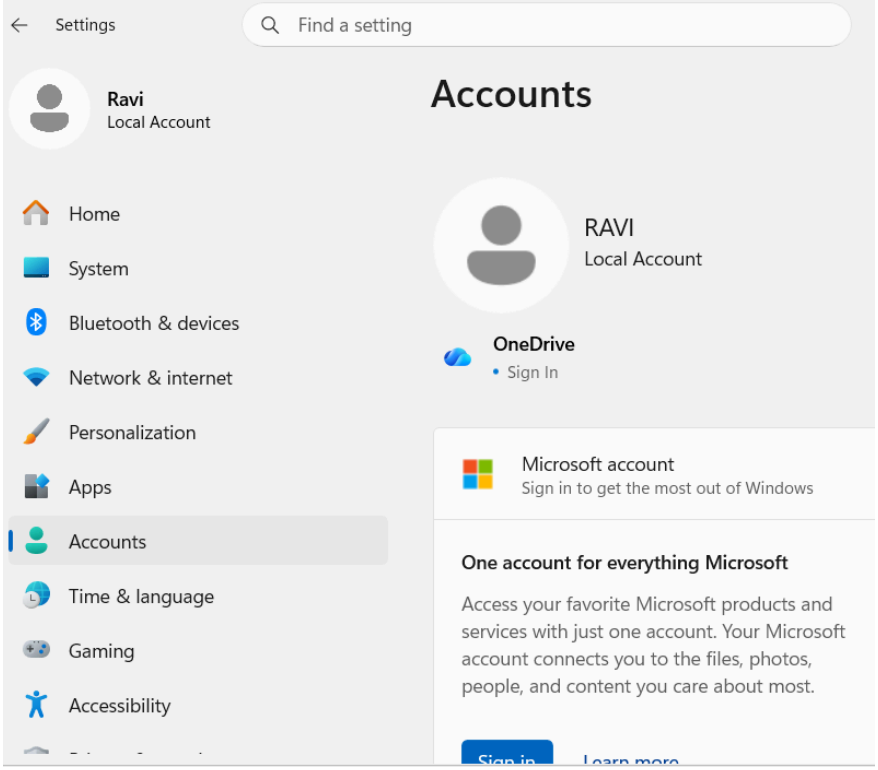

I am just gonna deny Ravi from doing anything.

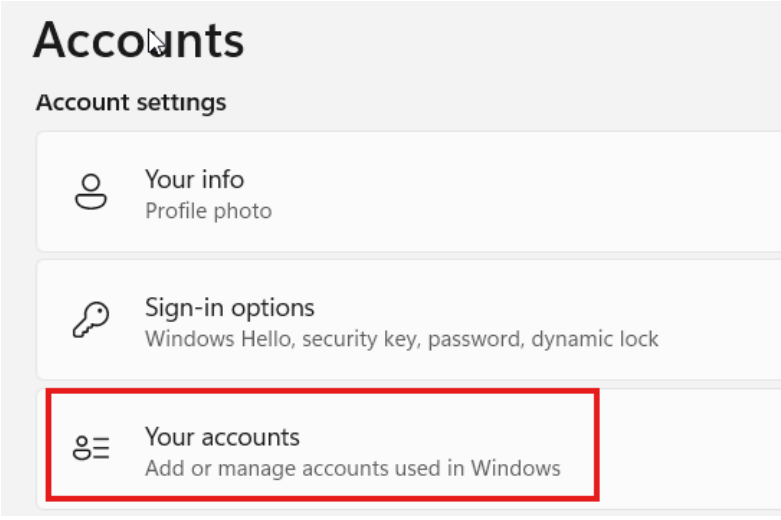

See Ravi now dont have permission to open the file. He needs admin approval.

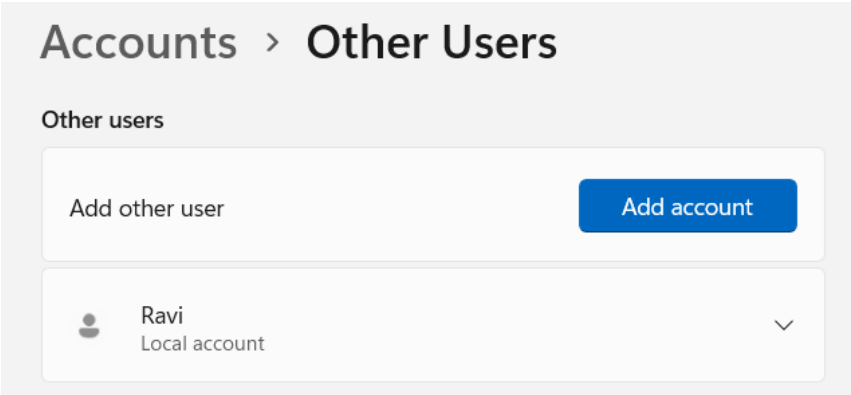

TASK 2 : Window User Accounts (Creating User accounts)

1) Go to the Search bar, search for Settings or Windows key+i.
2) Now click on Accounts.

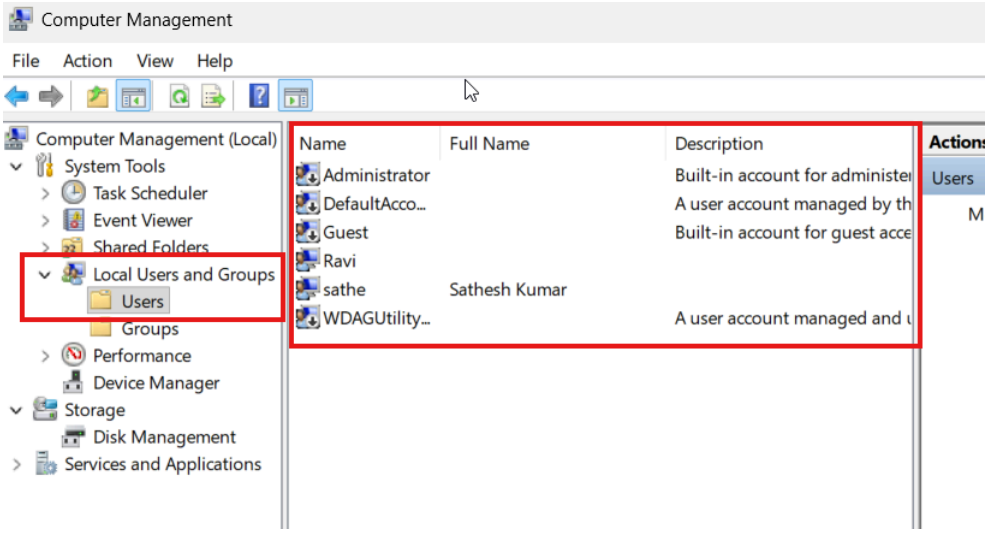

Now click on the Your accounts tab.

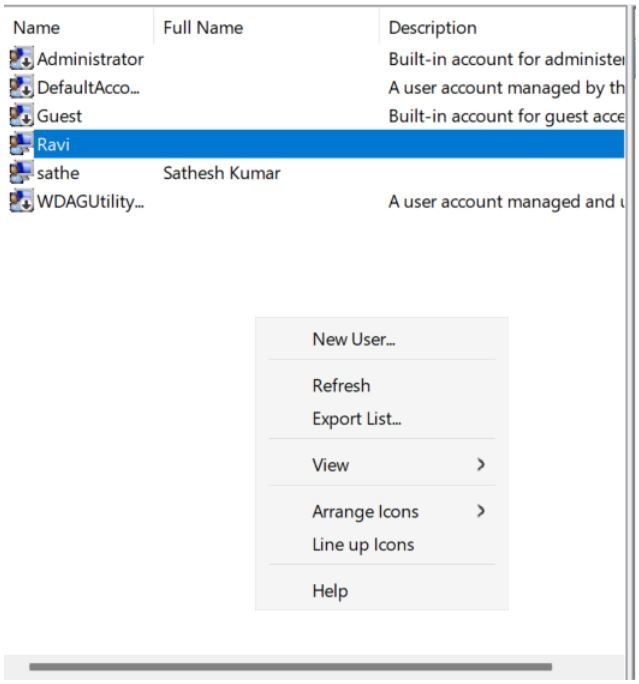

Over here you can add the user, remember you don't need their emails, just their name and set the password for them. Then done.

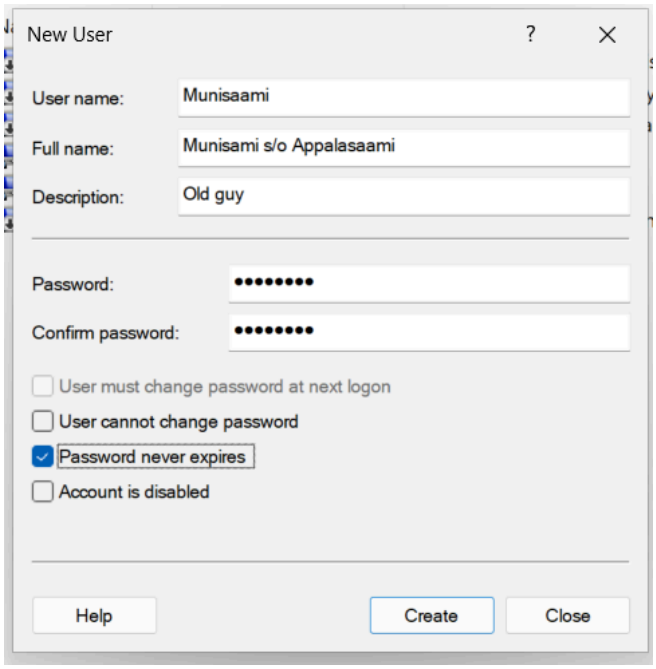

Adding user via Computer Management

You can also check for existing users via Computer Management.

Another super simple way to create accounts/user will be via the computer management as well. You just have to right click on the empty space there, and click on New User..

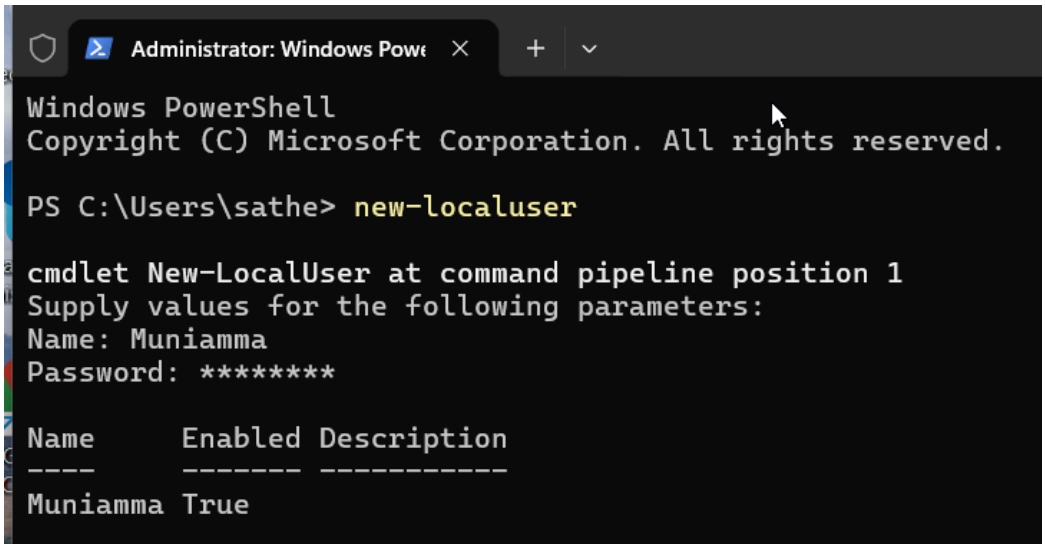

So this box will appear and you can add the user details accordingly plus you can edit the password as well and select any options for the password there.

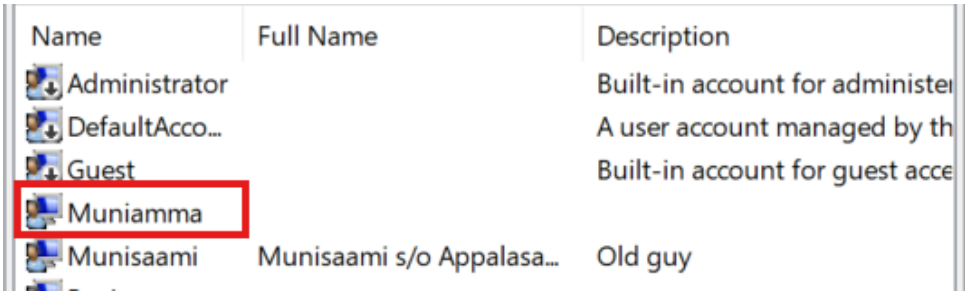

See now we have created one user, REMEMBER you need open this Computer Management as Administrator.

Adding user via Terminal

So we use “new-localuser” and then key in the Username and Password then boom its created.

Double check in the Computer Management and yeah its created.

```
PS C:\Users\sathe> new-localuser -name "Mookayi" -fullname "Mookayi d/o Raakayi"
description "housemaid"

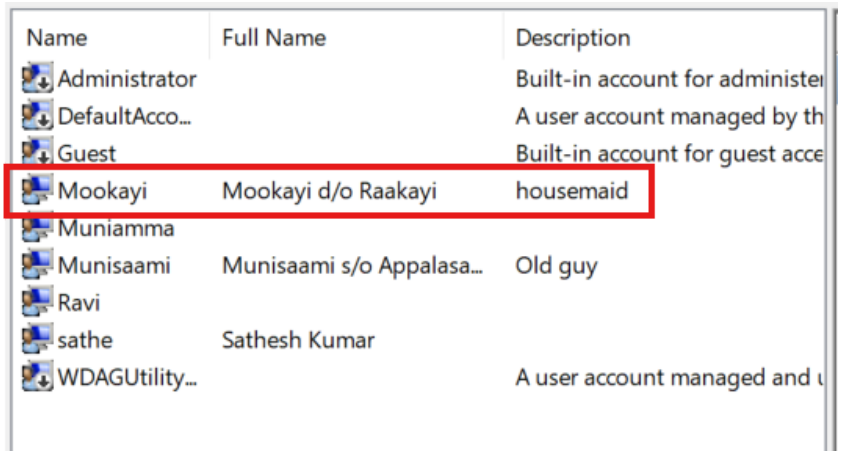

cmdlet New-LocalUser at command pipeline position 1
Supply values for the following parameters:
Password:
```

See this is another way to bind all the name, full name and description in one command line, but password cannot bind there it will prompt some error.

```
PS C:\Users\sathe> new-localuser -name "Mookayi" -fullname "Mookayi d/o Raakay
description "housemaid"

cmdlet New-LocalUser at command pipeline position 1
Supply values for the following parameters:
Password: ********

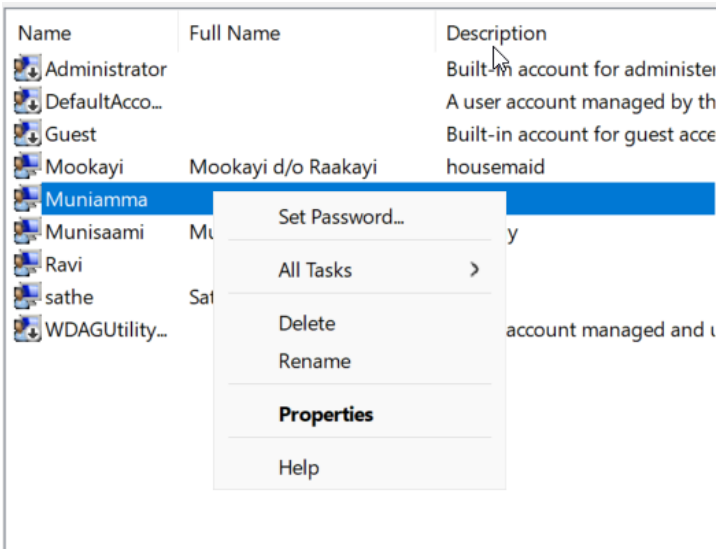

Name    Enabled Description
----    ------- -----------
Mookayi True    housemaid
```

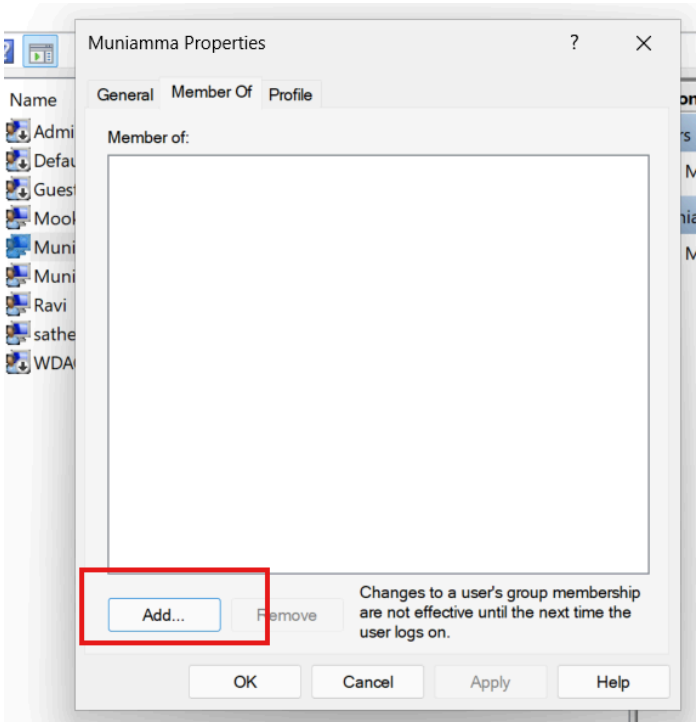

See now it has been created together with the Description and Full name and earlier it was just the name for Muniamma.

EXTRA NOTE: To remove user you can also use “remove-localuser -name “Nameoftheuser”

TASK 3 : Window User Accounts (Creating Permissions for User accounts) with Computer Management & Terminal.

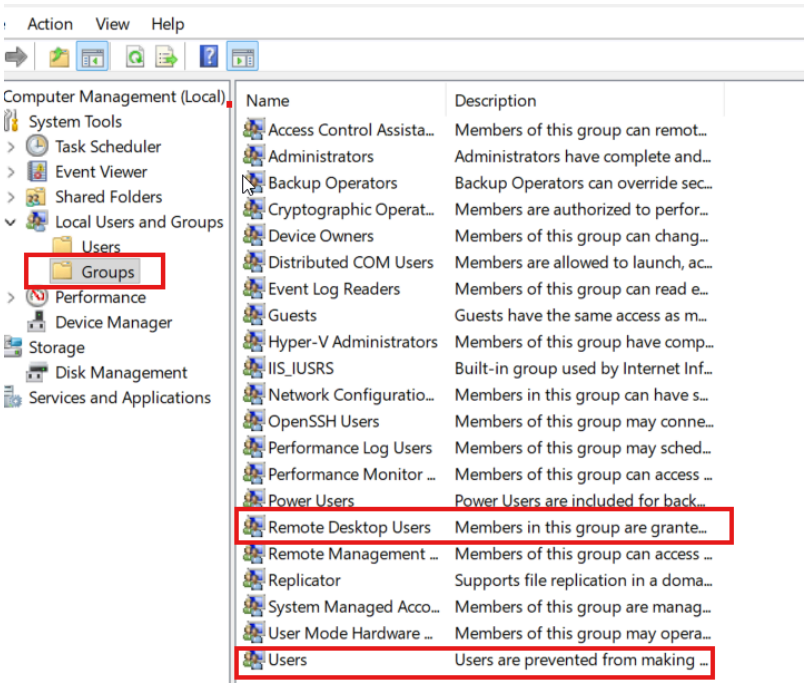

Click on Properties under the user (Local Users & Groups).

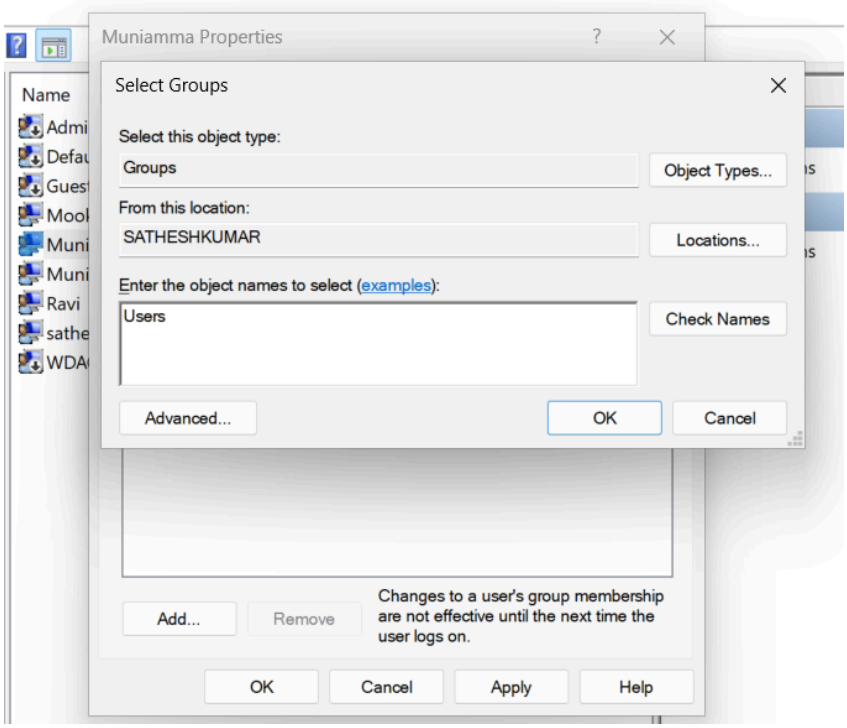

Click on Add.

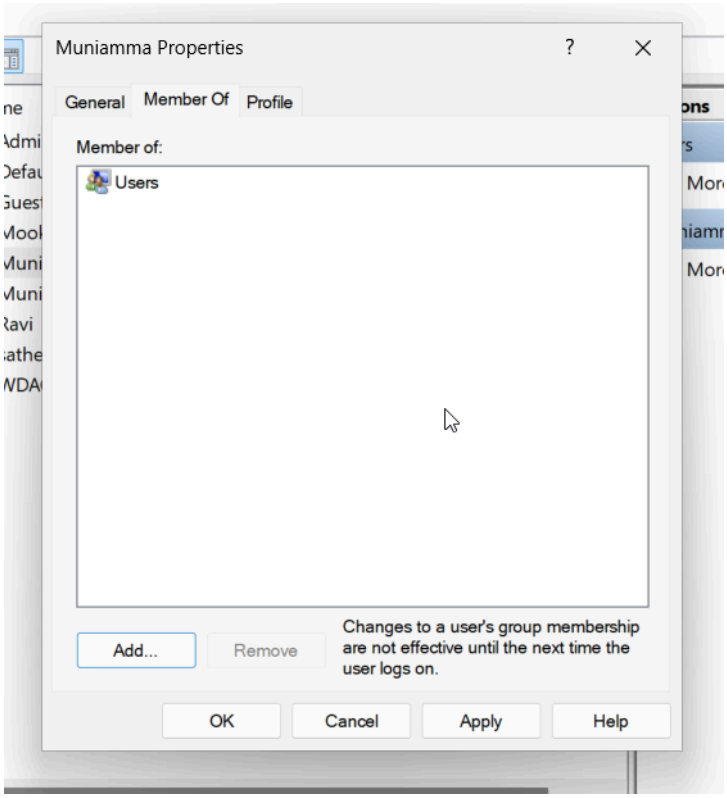

So now we are gonna add him to a group but which group? What do we type there? Ahh i gotchu, so now go to the group file below the local users and look all those groups, read the description.

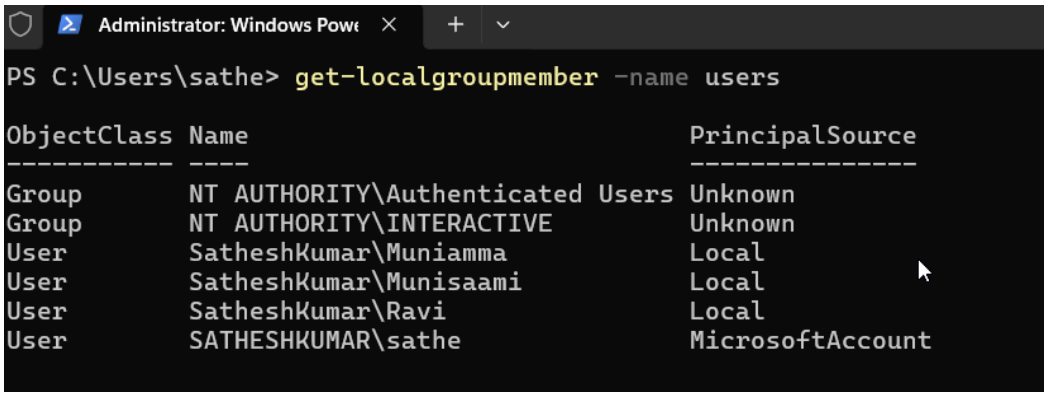

So if you see here, Remote Desktop Users are normally if you're a help desk, you can grant the permission to some users if they wanna WFH (work from home). Just add them in the Group of Remote Desktop Users. But now we are going to choose the Users group and add this user in the group as a member.

Now we just type Users or you can click on Check Names then click OK.

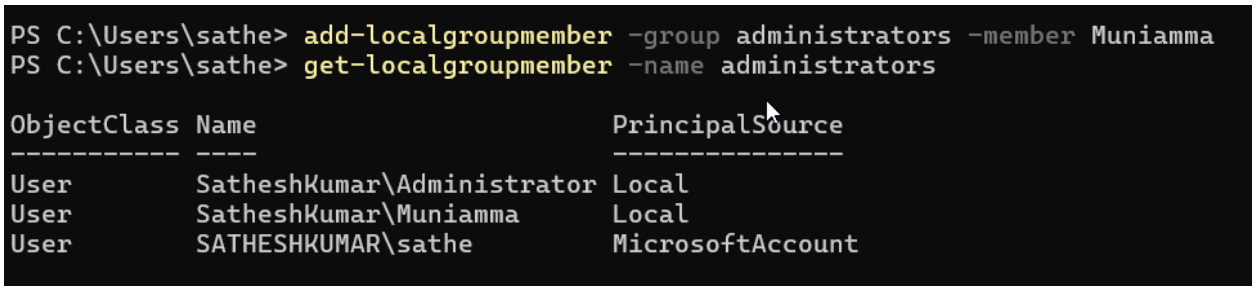

So booommm Muniamma is now in the Users group. Just click Apply then OK.

So in the terminal type “get-localgroupmember -name users” then you can see all the users added previously.

This is to check who is the administrators.

See now I added Muniamma to the administrators group with this command. “add-localgroupmember -group administrators -member Muniamma”.

TASK 4 : Managing Windows Permissions with CLI

Cd : Change directory
Ls: list all the files
Mkdir: make directory
New-item (Filename): create new file
Clear: clear all the command line
Icacls (filename): will list the permissions for the users

Now i want to add Read permission for user Muniamma for a file named as "goodstuff"

```
PS C:\Users\sathe> icacls goodstuff /grant Muniamma:r
processed file: goodstuff
Successfully processed 1 files; Failed processing 0 files
PS C:\Users\sathe> icacls goodstuff
goodstuff SatheshKumar\Muniamma:(R)
          NT AUTHORITY\SYSTEM:(I)(OI)(CI)(F)
          BUILTIN\Administrators:(I)(OI)(CI)(F)
          SATHESHKUMAR\sathe:(I)(OI)(CI)(F)
          SatheshKumar\Ravi:(I)(OI)(CI)(F)

Successfully processed 1 files; Failed processing 0 files
PS C:\Users\sathe>
```

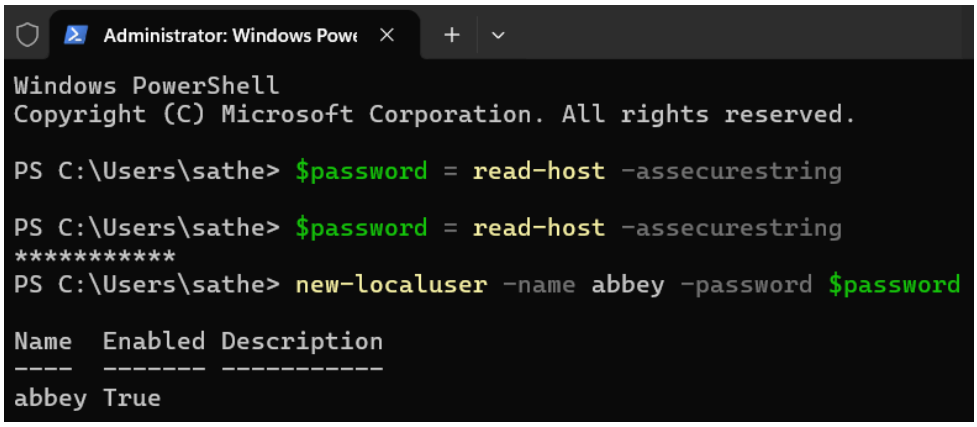

The command to add permission is "icacls goodstuff /grant Muniamma:r" then to check whether the permission given or not, you may use "icacls goodstuff".

```
PS C:\Users\sathe> icacls goodstuff /remove muniamma
processed file: goodstuff
Successfully processed 1 files; Failed processing 0 files
PS C:\Users\sathe> icacls goodstuff
goodstuff NT AUTHORITY\SYSTEM:(I)(OI)(CI)(F)
          BUILTIN\Administrators:(I)(OI)(CI)(F)
          SATHESHKUMAR\sathe:(I)(OI)(CI)(F)
          SatheshKumar\Ravi:(I)(OI)(CI)(F)

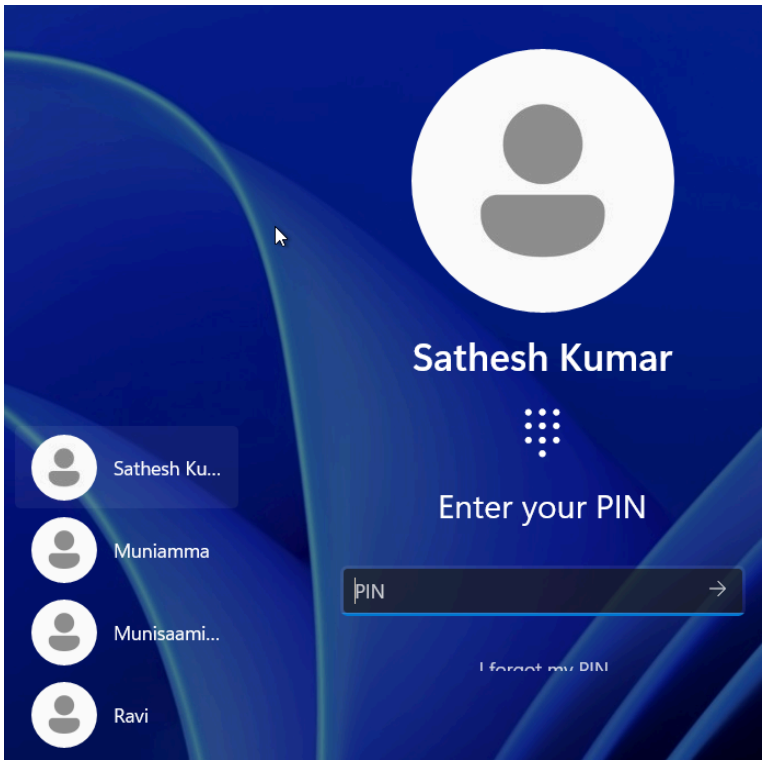

Successfully processed 1 files; Failed processing 0 files
PS C:\Users\sathe>
```

The command to remove permission is "icacls goodstuff /remove Muniamma"

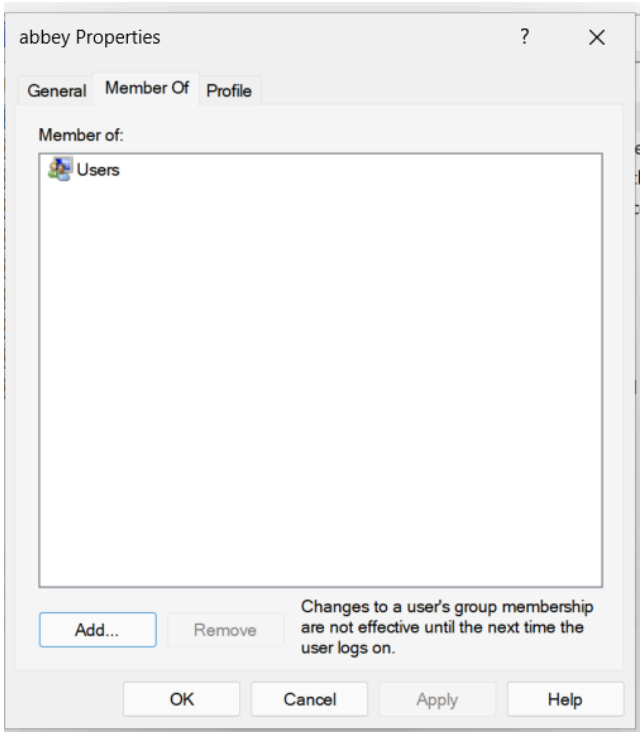

TASK 5 : Changing User Account Control Settings in Windows

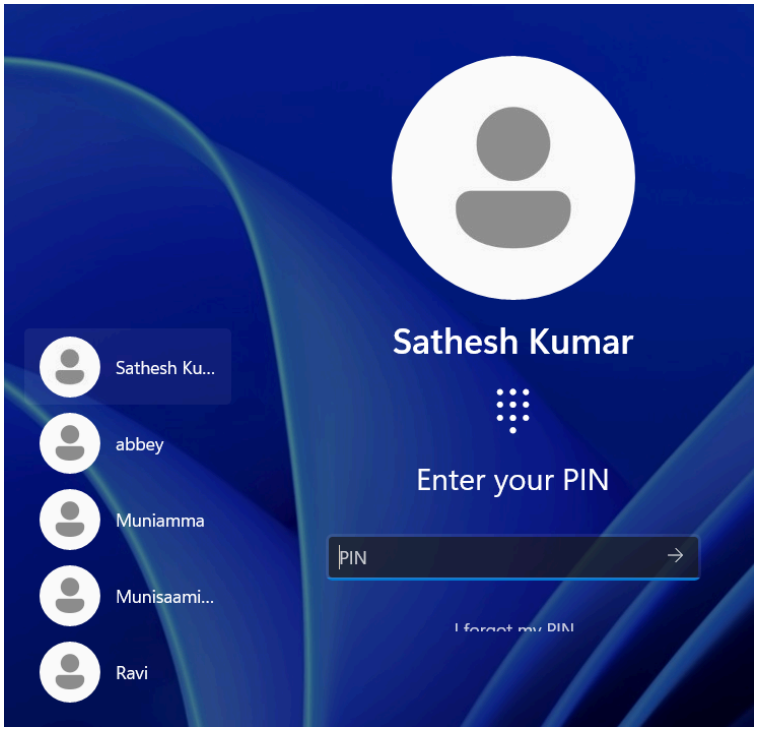

Additional Information, when you wanna add users and you wanna use same password for all the local users then, the command is " $password = read-host -assecurestring" this is to set the general password where you can you use it everytime when you create the user as in the picture above.

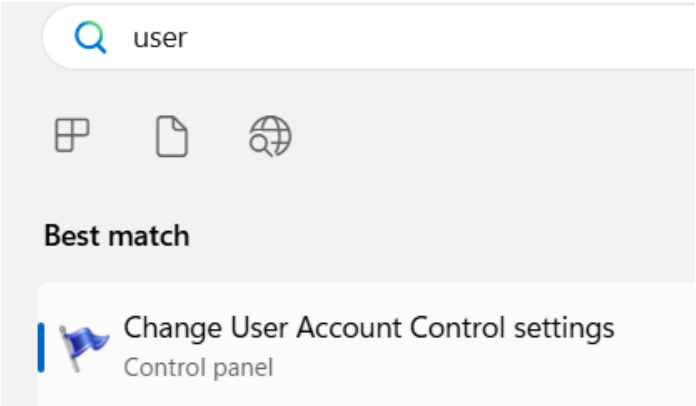

Here you cannot see user "Abbey" right? Remember I asked you to add them to "Users Group" as a member? So ya we are going to add this user as a member.

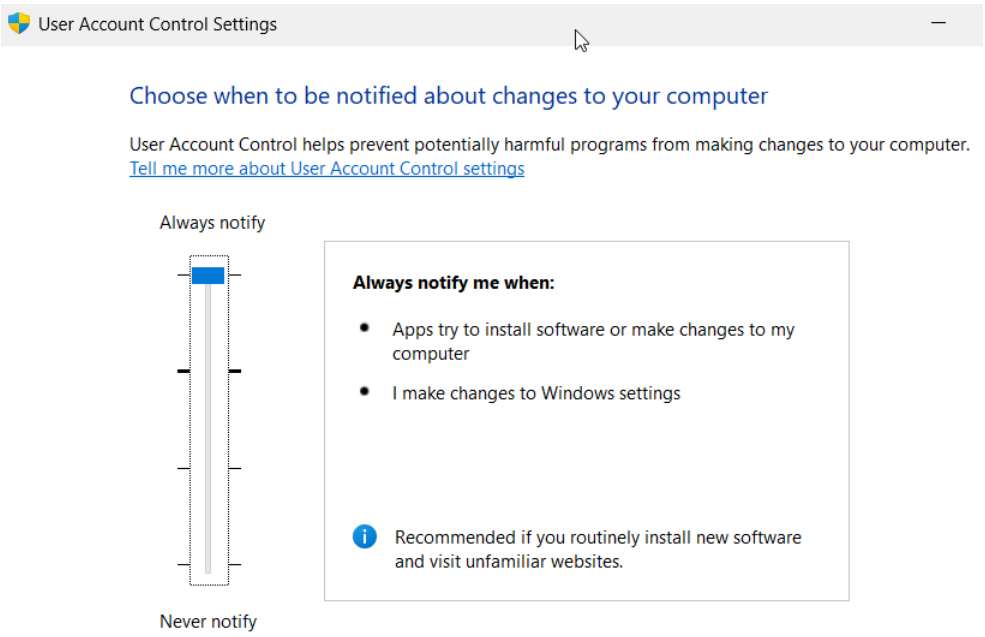

Yup now “Abbey” is one of the members in Users group.

See there you go!

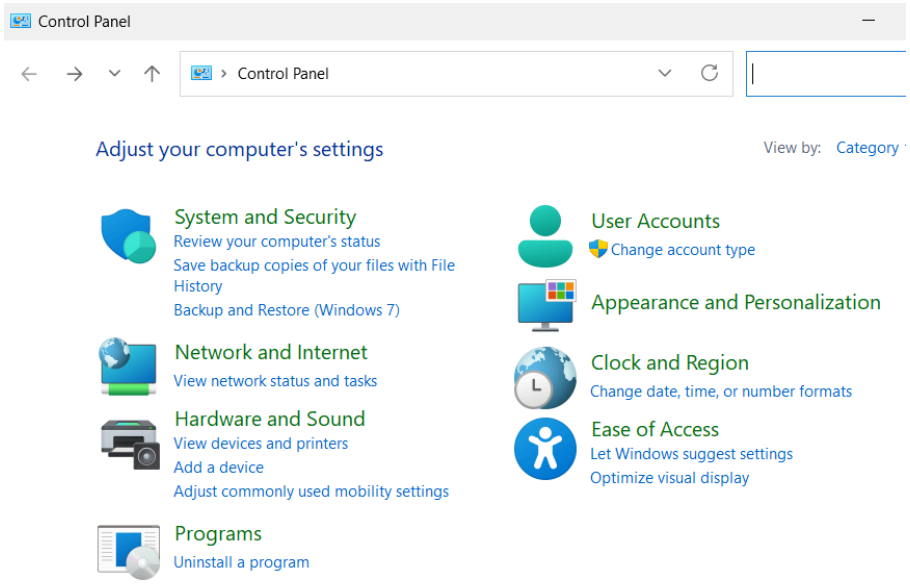

So this where we can control the User Control Permissions.

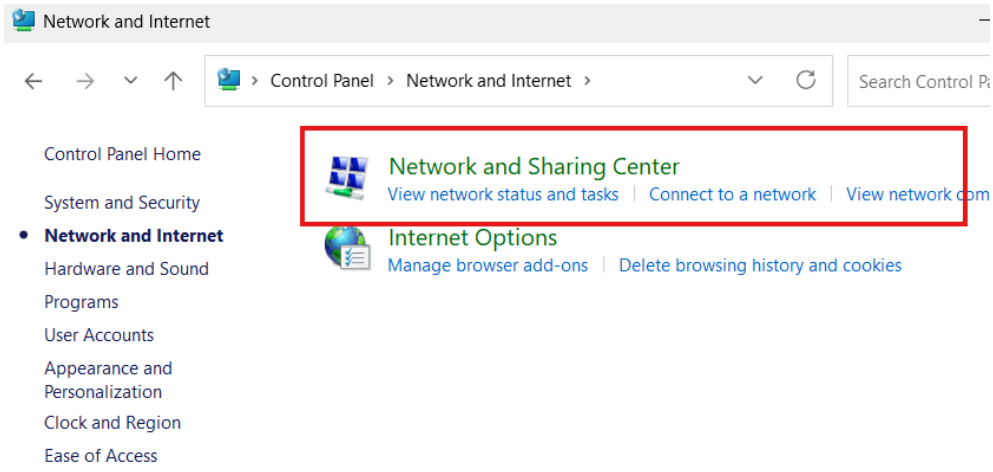

There are four levels and the second level is always recommended because the highest level is annoying whenever you wanna install softwares you need an admin password. The other two low levels are basically weak in the security so not recommended.

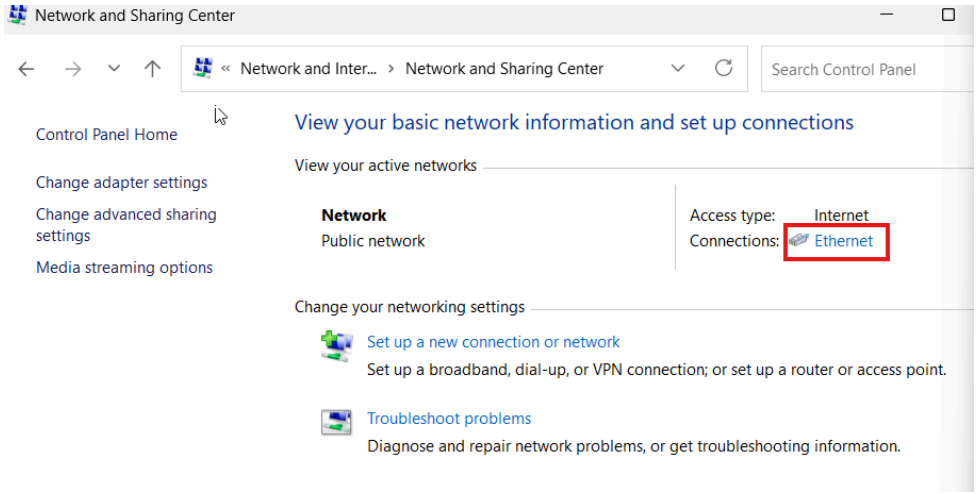

TASK 6 : Introduction to Control Panel in Windows

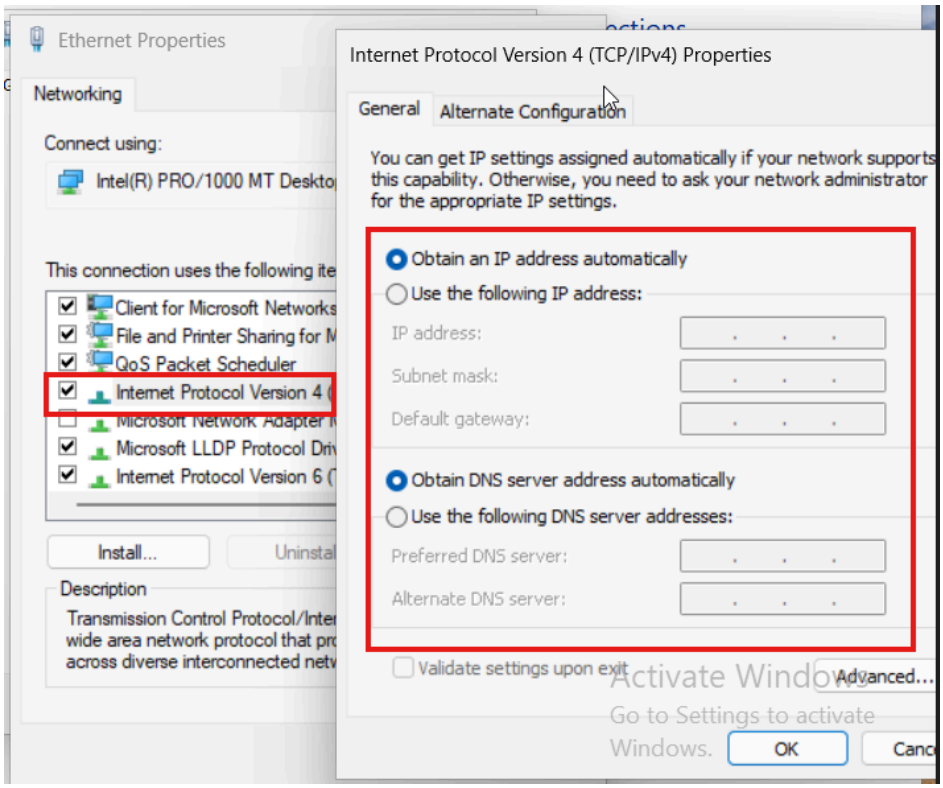

This is another view of the control panel. Most probably all of us used it, but i just wanna click one of the important places we always use as a helpdesk. Its Network and Internet.

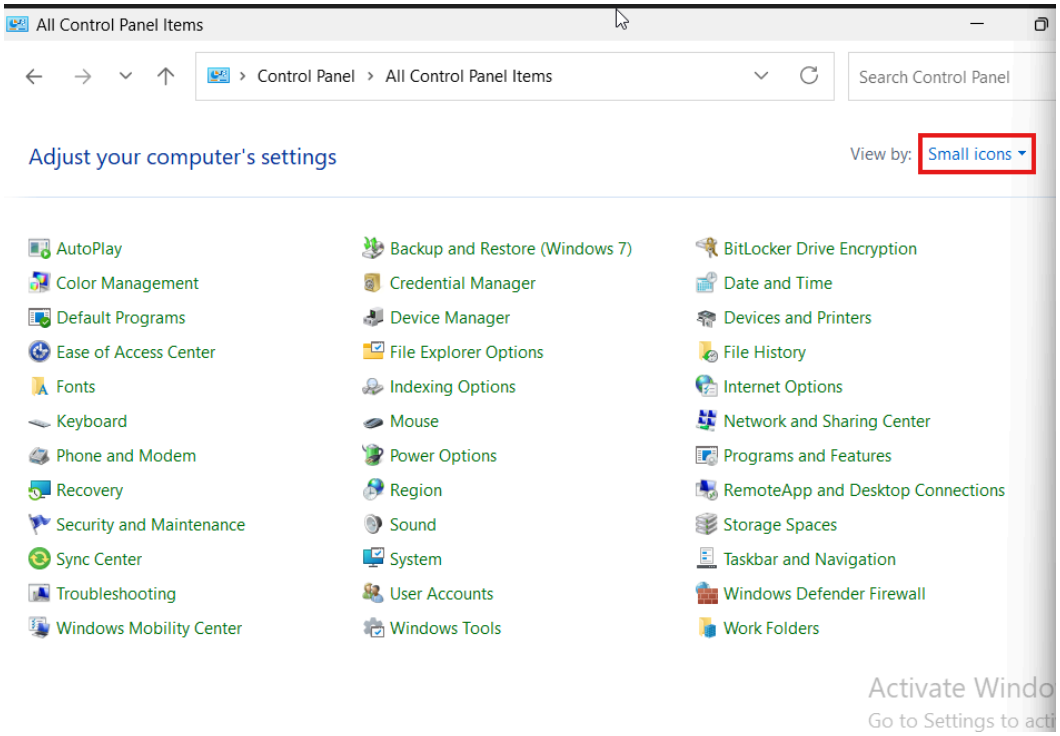

So over here we always used to change our IP address from dynamic to static for some network troubleshooting reason or even we set up static ips for printers.

Click on the ethernet button and click on properties.

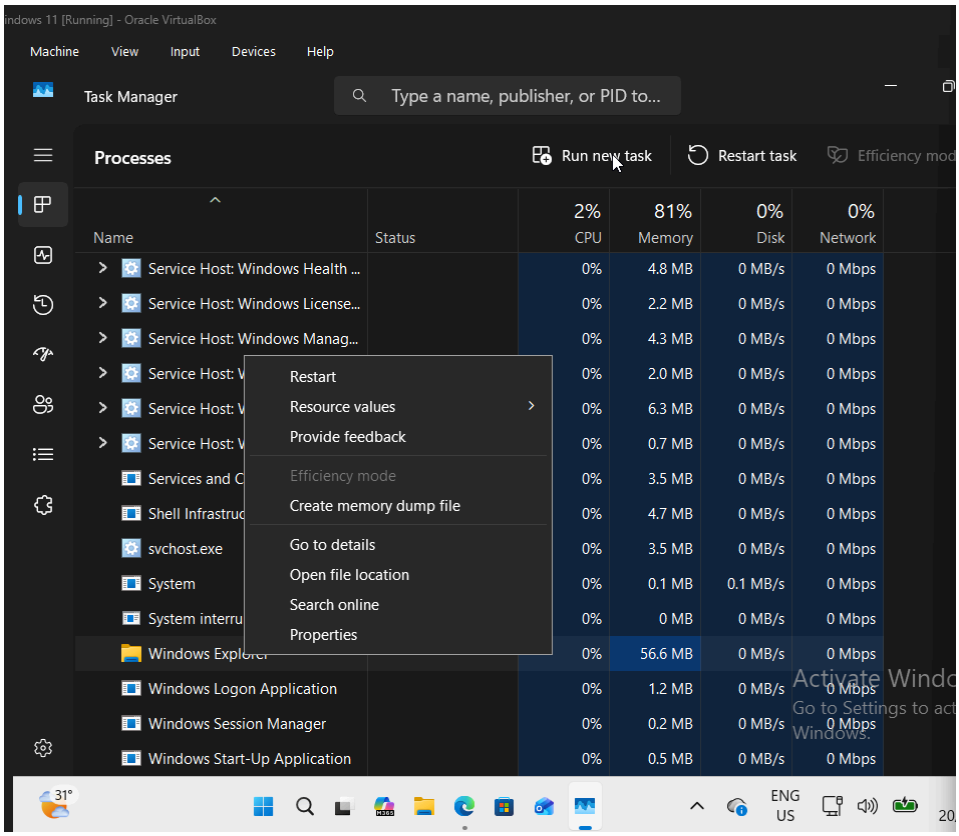

Click on the Internet protocol 4, basically its IPV4. This is where we always set our ip address and dns.

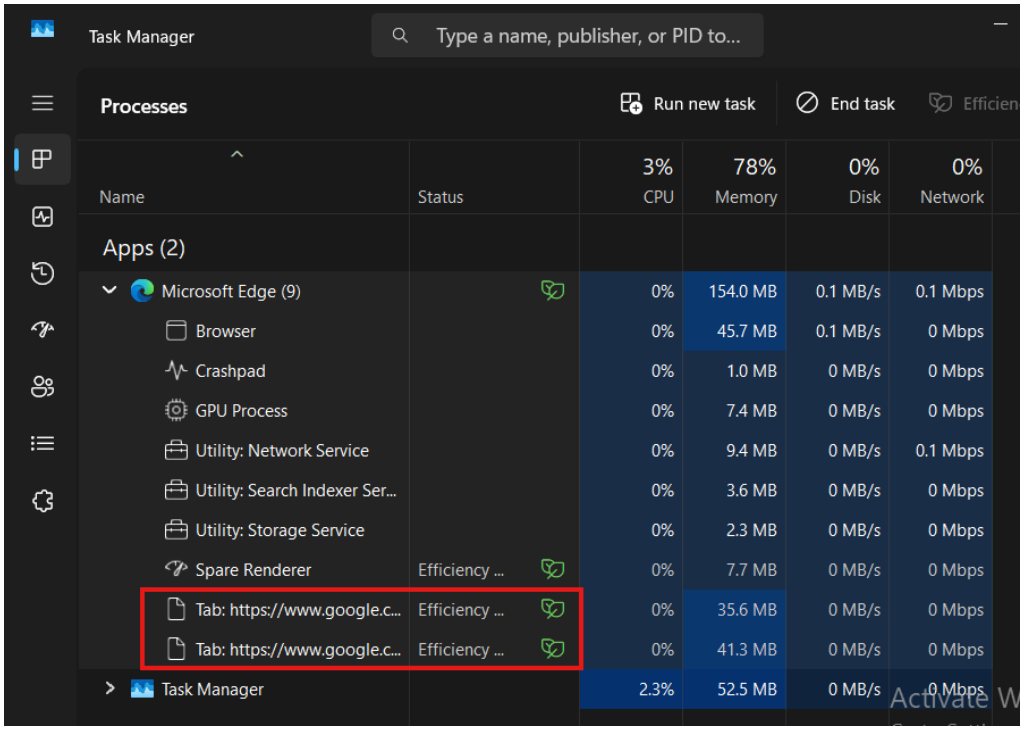

This is another view where you can change to smaller icons and then you can see a lot of panels that you can control at one place.

TASK 7 : How to use Task Manager as Windows Admin

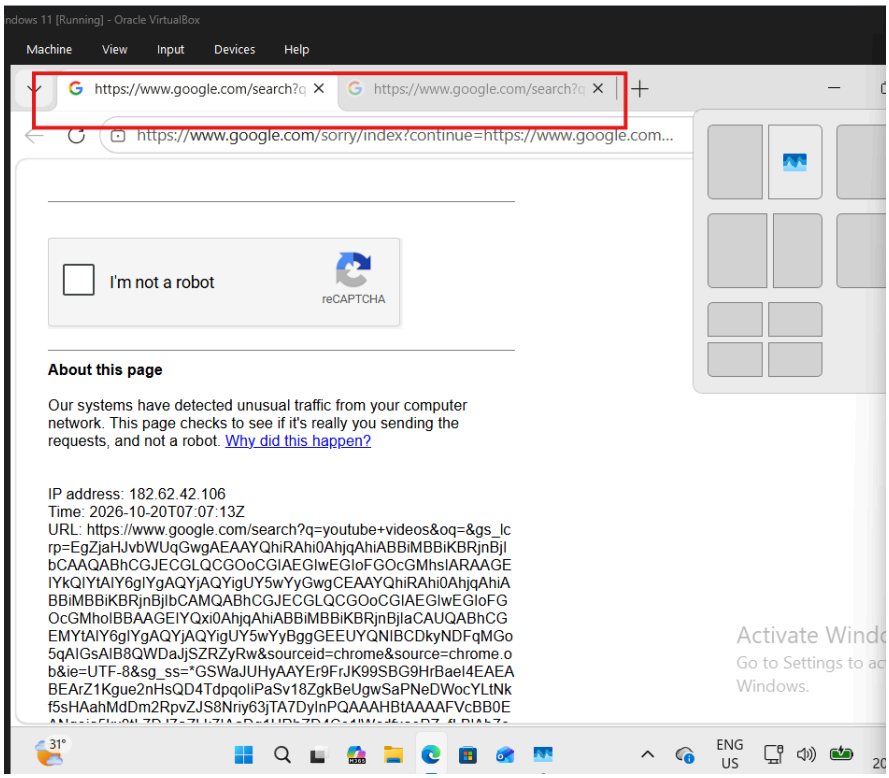

Task Manager can be opened by just typing “Task Manager” in the search bar.

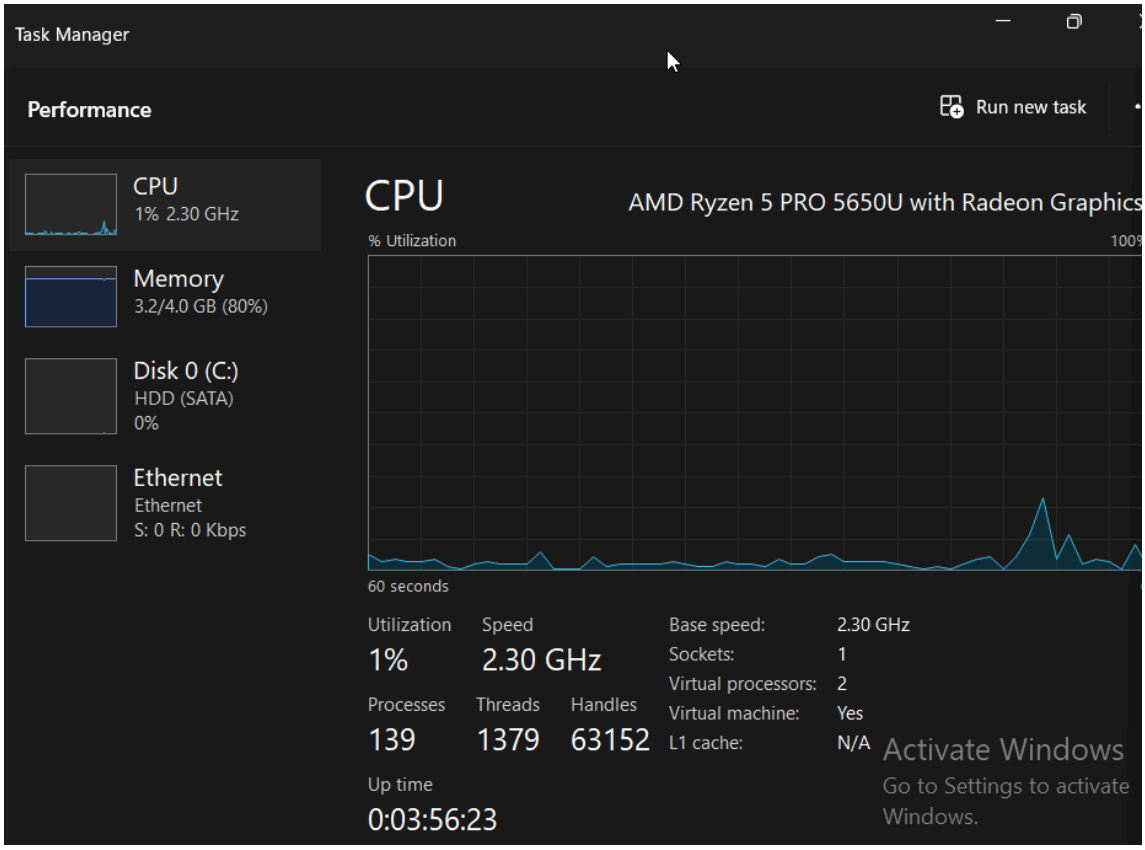

So if you are a windows admin, then if suddenly for example, Windows explorer isn't working, to end or restart you just find for Windows explorer and right click on it then select the options you wanna perform.

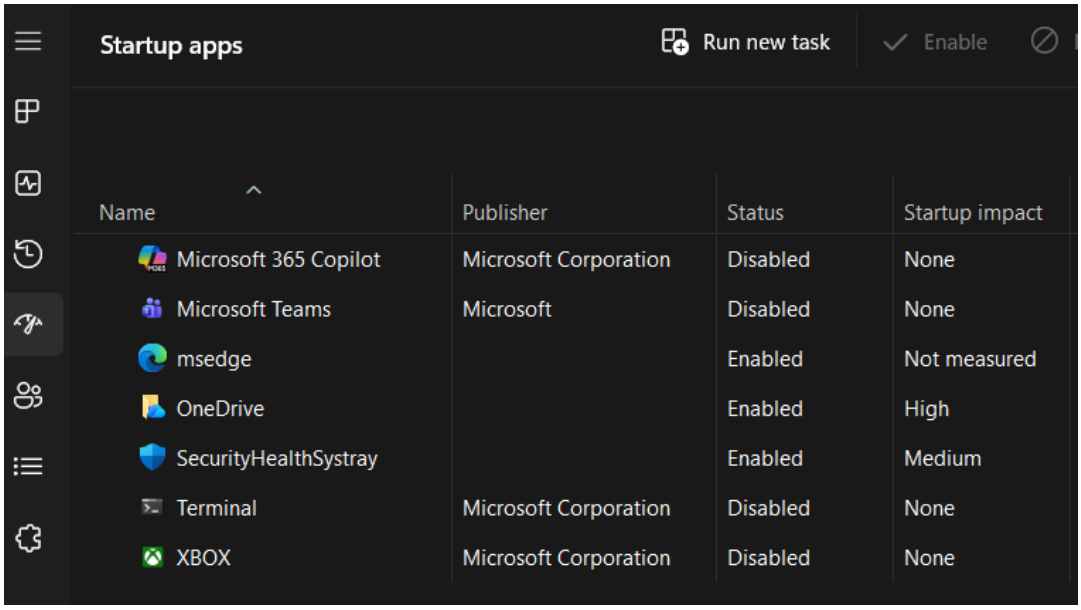

So these two things are actually tabs I opened in Microsoft Edge browser, so its cool you can even handle the Tabs in your browser. (I have attached the browser tabs screenshot below)

Performance Tab

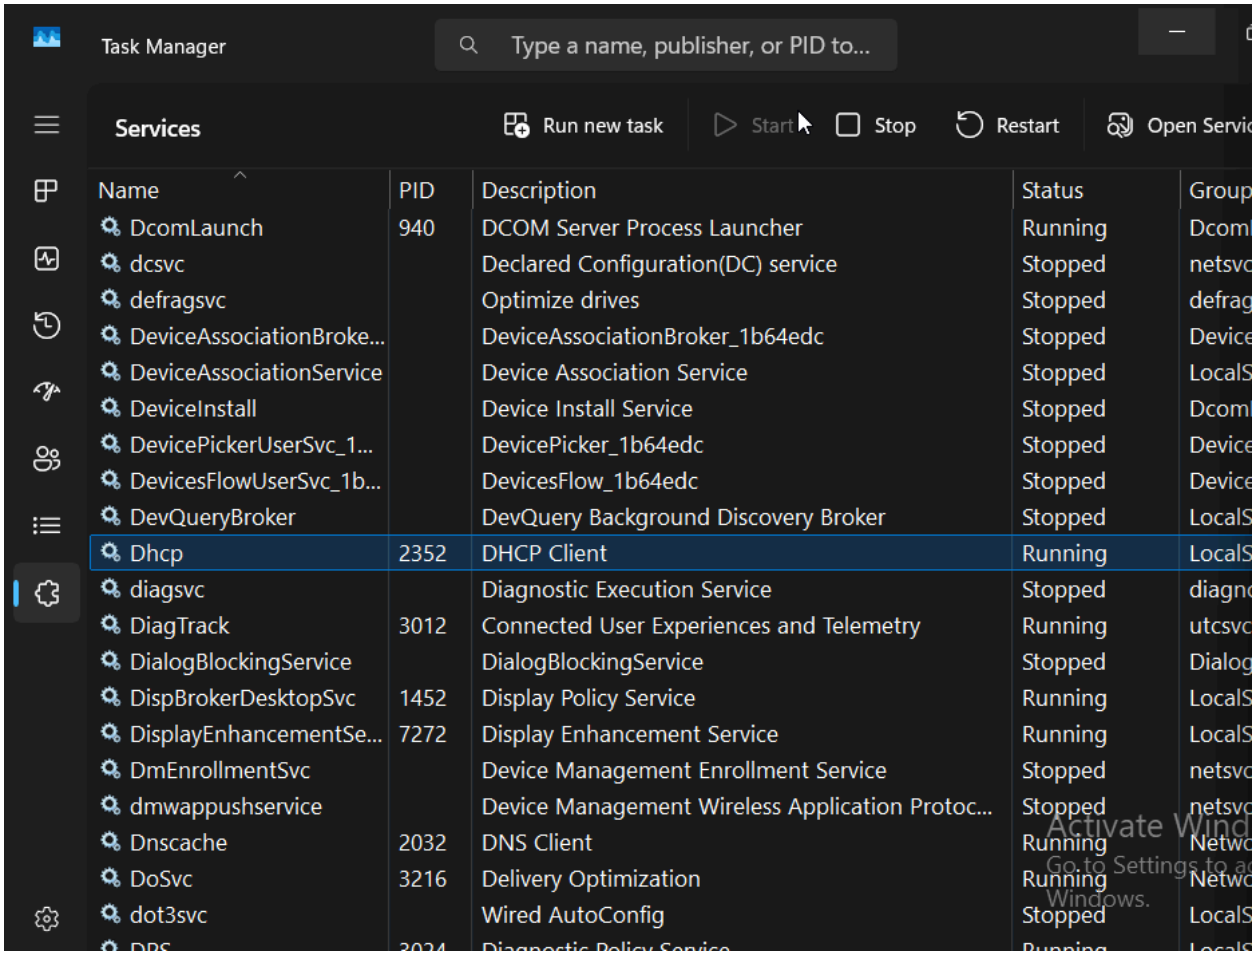

This is where you can see your Computer/laptop's actual performance.

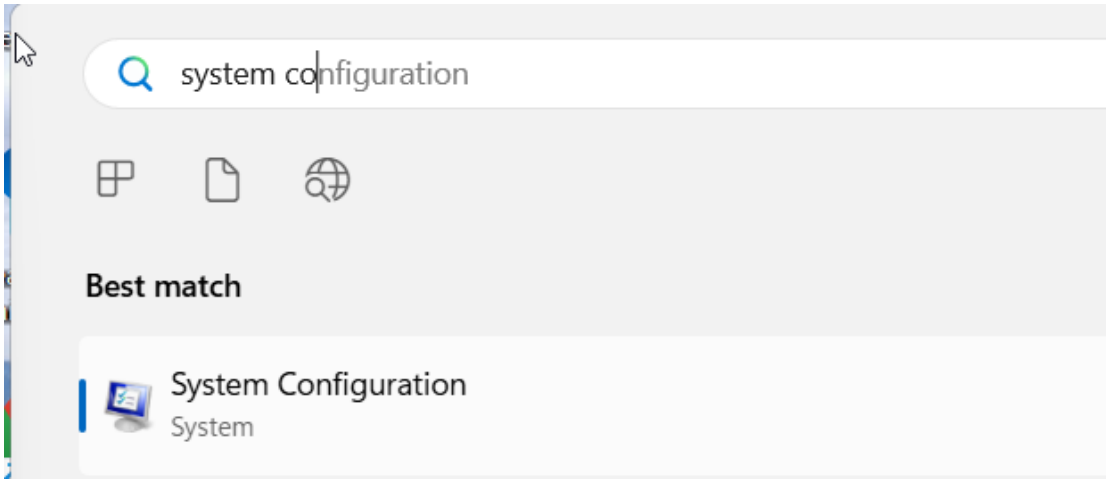

This is another section in the Task Manager where you can see apps that will start when your computer gets rebooted.

Services Tab

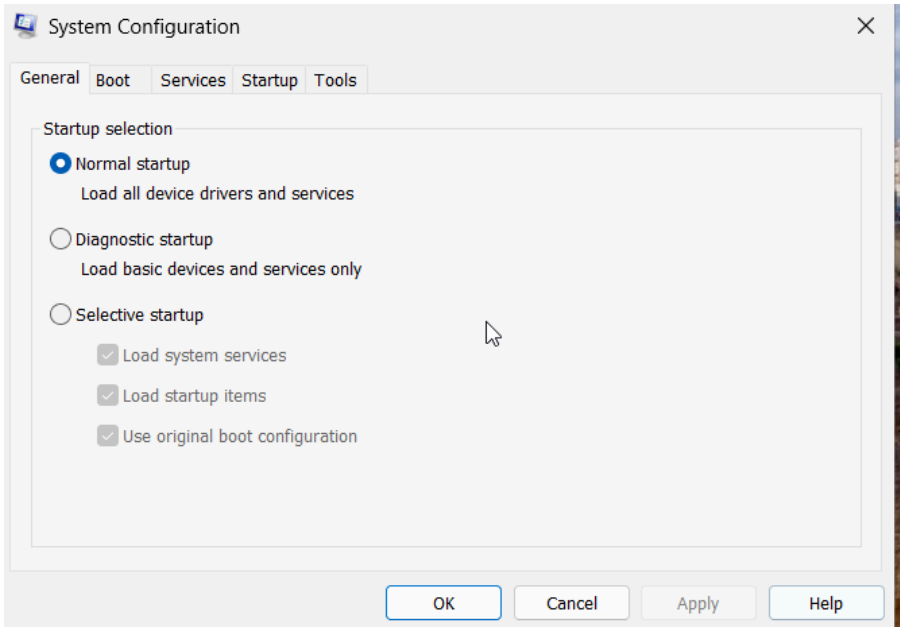

This is another place where we can restart or stop the services temporarily for example Spooler service, then DHCP and credential manager.

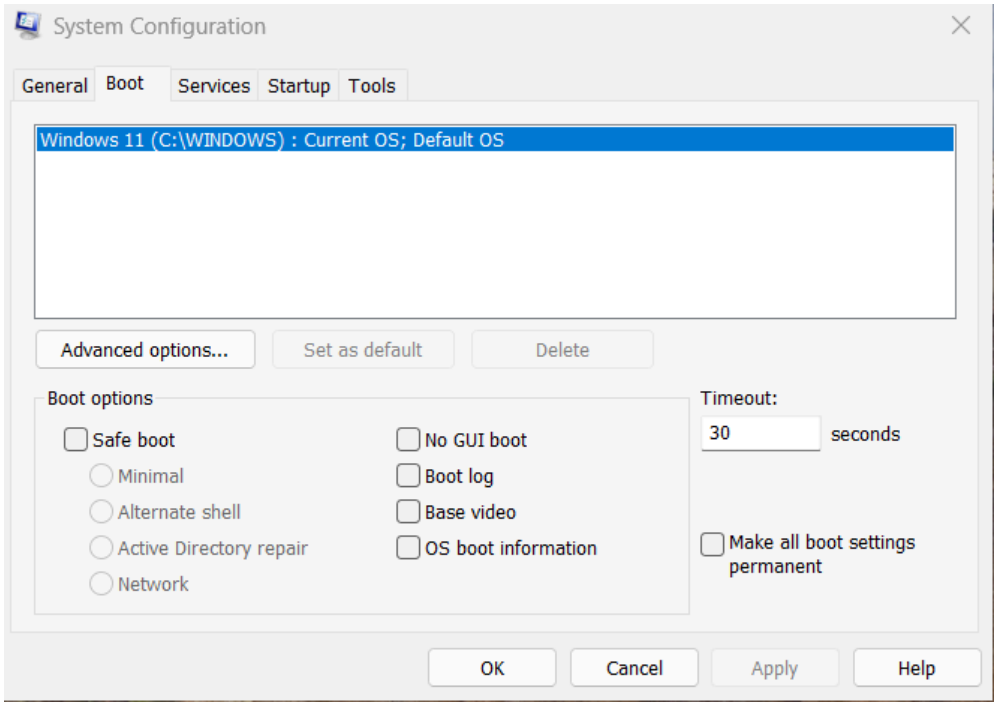

TASK 8 : Adjusting System Configuration in Windows

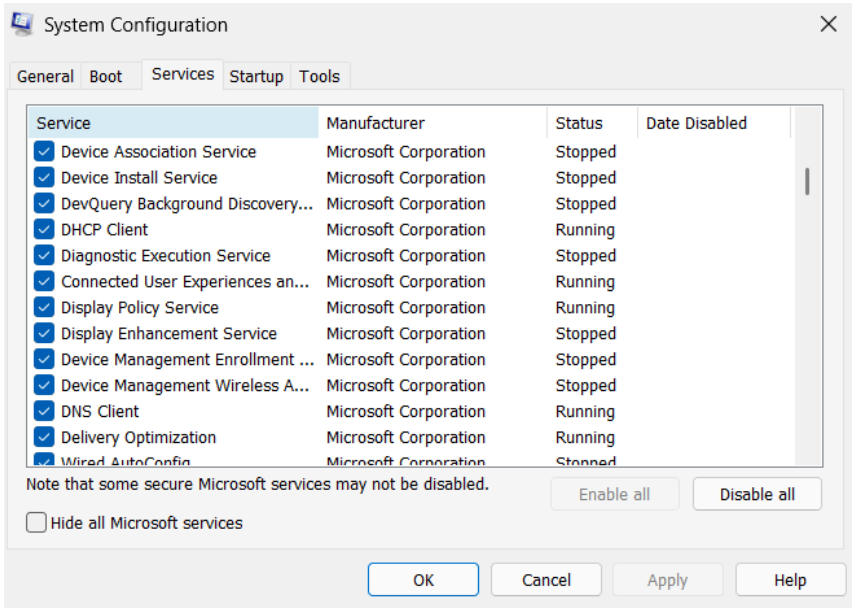

This is where we are going to adjust the config.

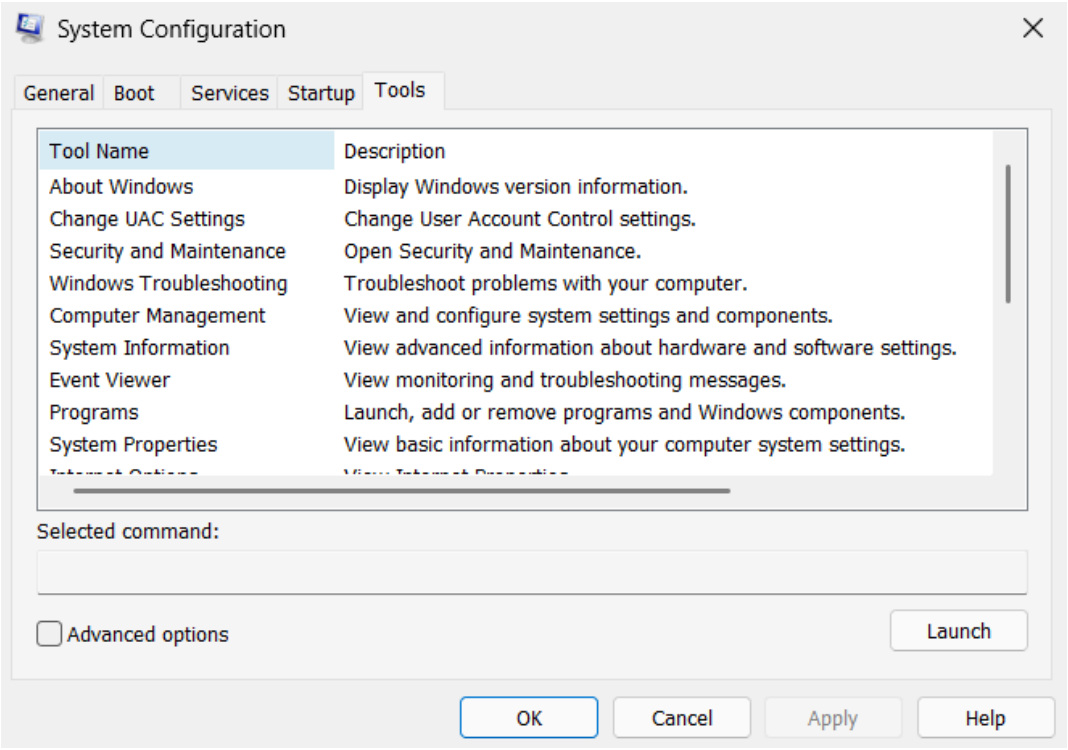

This is where you can customize or decide how you want your system to start up.

This is another space where you customize your boot process like if you want your windows to boot with safe mode then yeah you can customize here.

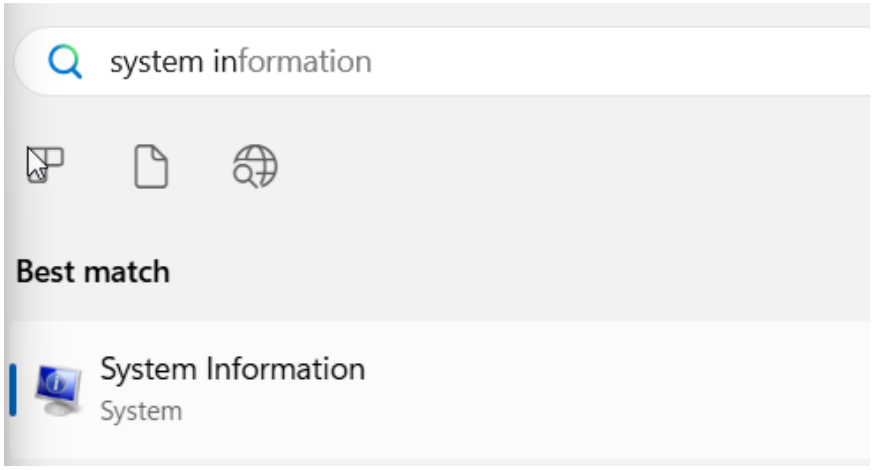

Here you can disable and stop some services if you notice any unusual issues.

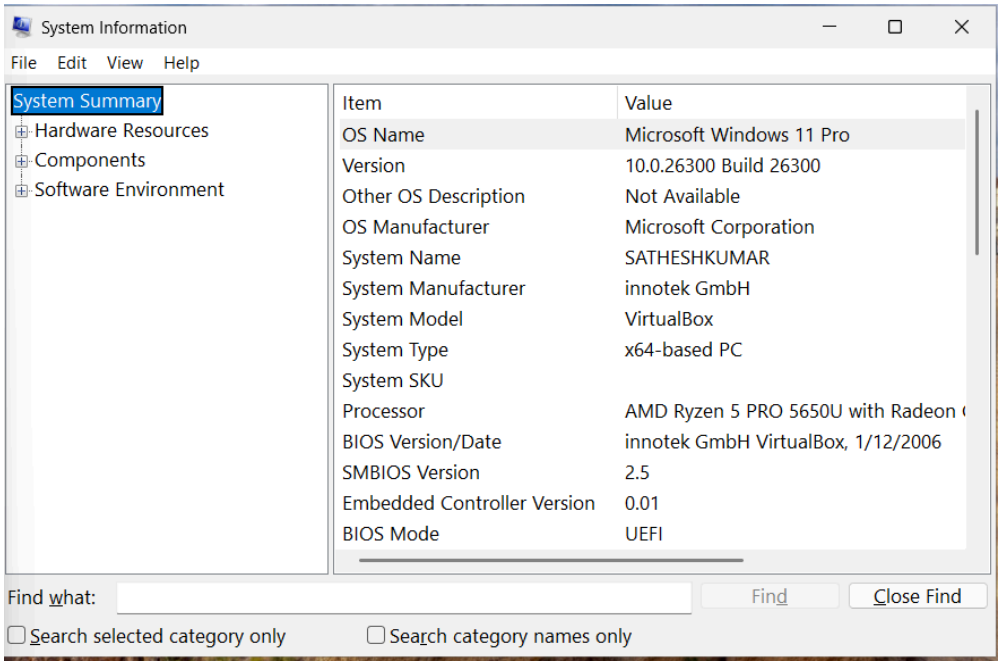

These are the tools windows have, and we can even launch it from here.

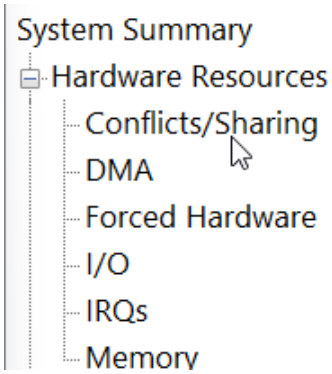

TASK 9 : How to find System Information in Windows.

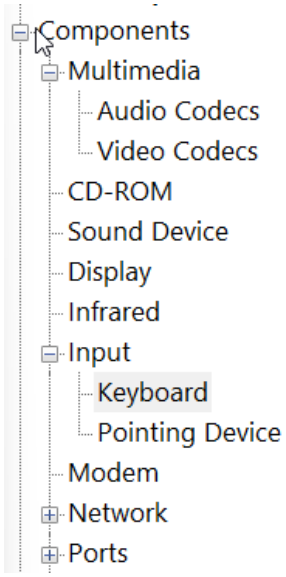

Type System Information in the search bar.

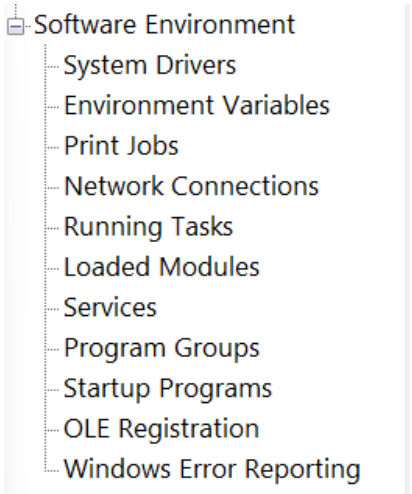

So this is where you will learn about your Windows version and other system information.

System Summary info

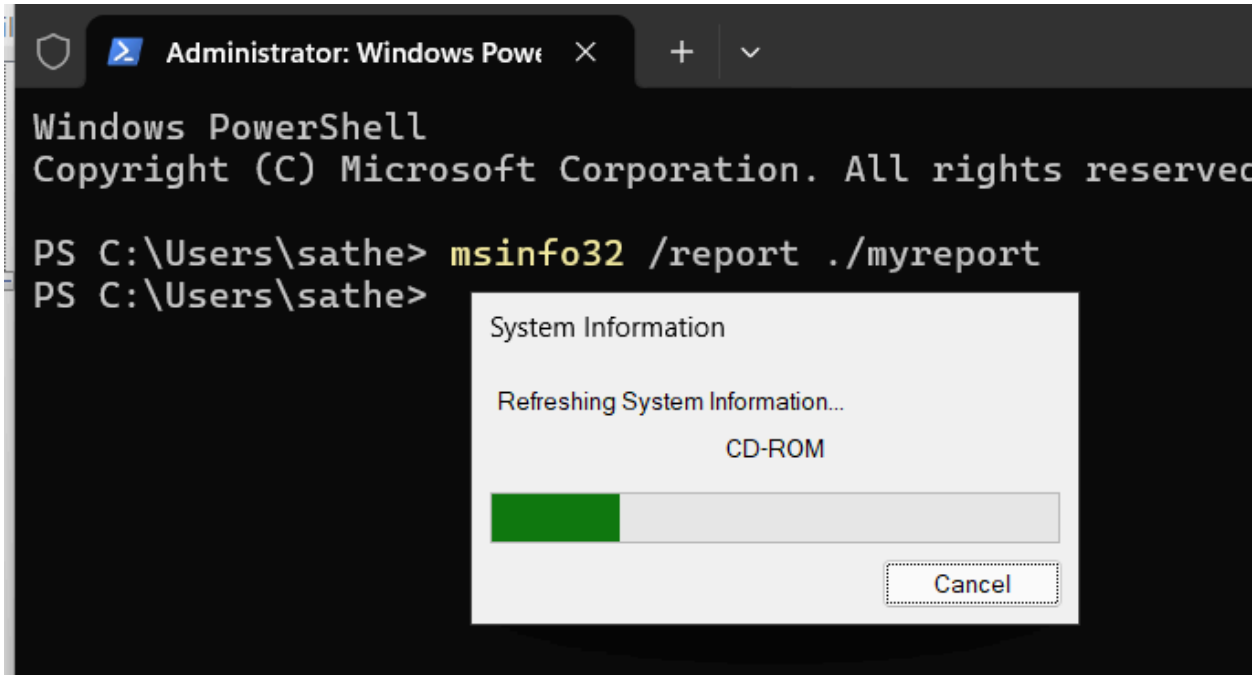

Components information

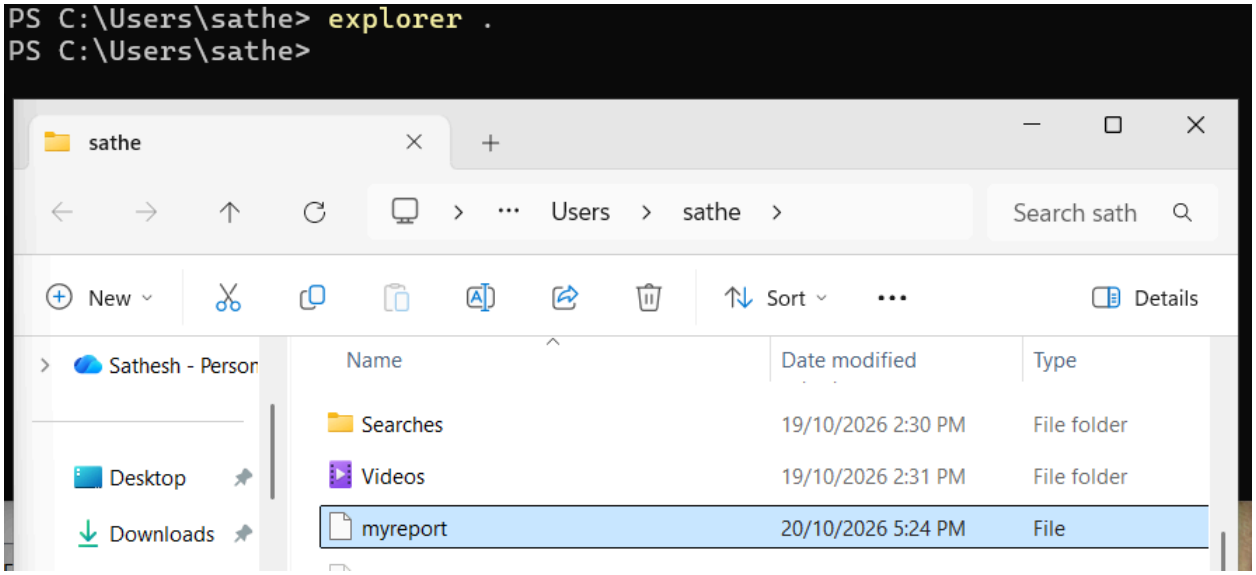

Software information

Retrieving System Information via Terminal

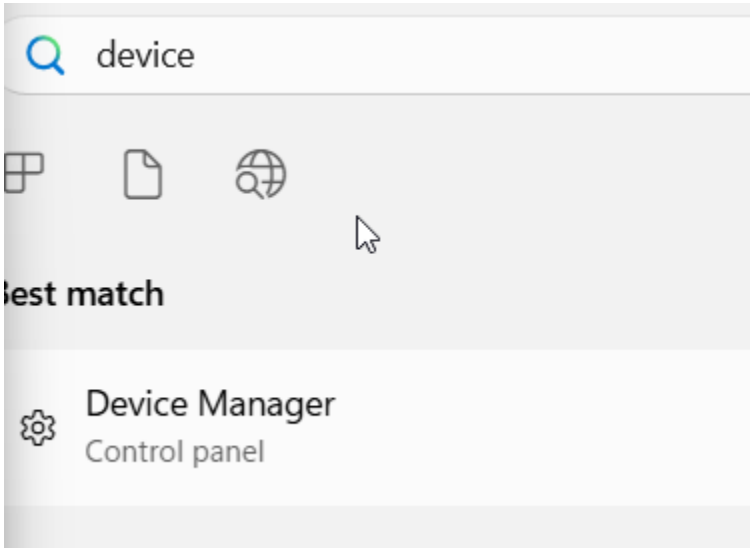

The command to retrieve the report is “msinfo32 /report ./myreport”.

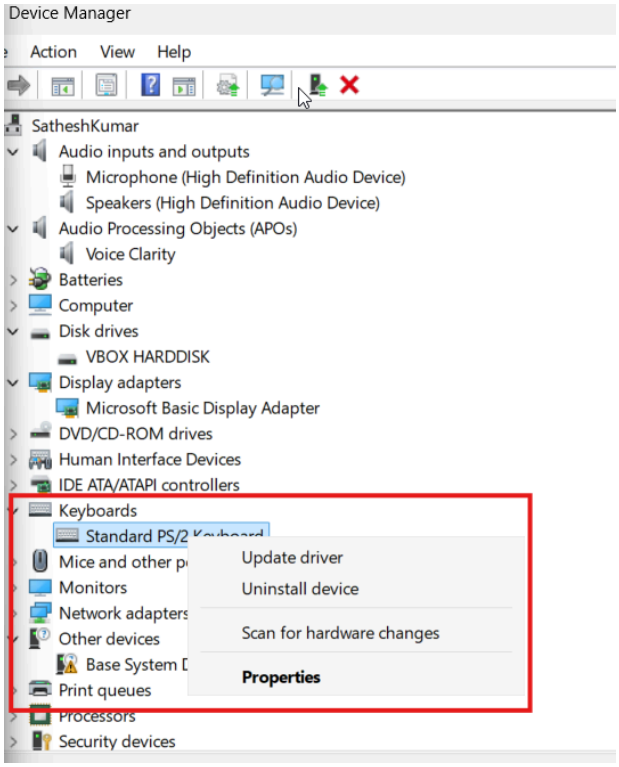

See when I type “explore .” it will open the file location in file explorer.

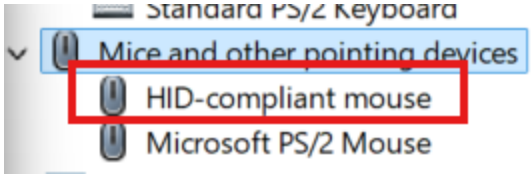

TASK 10 : Using Device Manager to check drivers in Windows

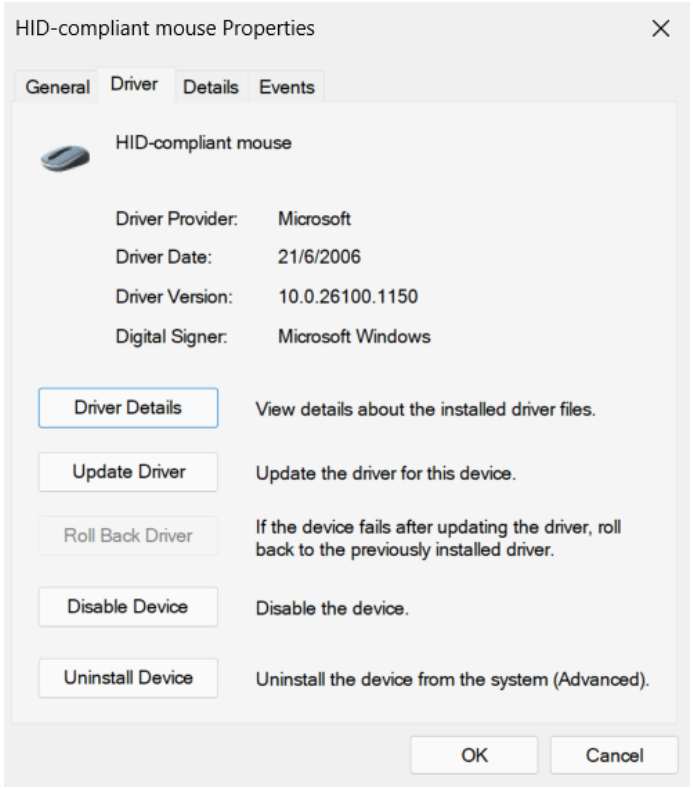

Search for this “Device Manager”.

See here all these devices has its driver, if you ever wanna update your drivers, install or uninstall, you may do it here though.

See this is my plugged in mouse hahah cool right.

In the Properties of the mouse, you can even know your driver currently in use.
